## Introduction

he arts and sciences have become so extensive, that to facilitate their acquirement is of as much importance as to extend their boundaries. Illustration, if it does not shorten the time of study, will at least make it more agreeable. This Work has a greater aim than mere illustration; we do not introduce colors for the purpose of entertainment, or to amuse by certain combinations of tint and form, but to assist the mind in its researches after truth, to increase the facilities of introduction, and to diffuse permanent knowledge. If we

wanted authorities to prove the importance and usefulness of geometry, we might quote every philosopher since the day of Plato. Among the Greeks, in ancient, as in the school of Pestalozzi and others in recent times, geometry was adopted as the best gymnastic of the mind. In fact, Euclid's Elements have become, by common consent, the basis of mathematical science all over the civilized globe. But this will not appear extraordinary, if we consider that this sublime science is not only better calculated than any other to call forth the spirit of inquiry, the elevate the mind, and to strengthen the reasoning faculties, but also it forms the best introduction to most of the useful and important vocations of human life. Arithmetic, land-surveying, hydrostatics, pneumatics, optics, physical astronomy, &c. are all dependent on the propositions of geometry.

Much however depends on the first communication of any science to a learner, though the best and most easy methods are seldom adopted. Propositions are placed before a student, who though having a sufficient understanding, is told just as much about them on entering at the very threshold of the science, as given him a prepossession most unfavorable to his future study of this delightful subject; or "the formalities and paraphernalia of rigour are so ostentatiously put forward, as almost to hide the reality. Endless and perplexing repetitions, which do not confer greater exactitude on the reasoning, render the demonstrations involved and obscure, and conceal from the view of the student the consecution of evidence." Thus an aversion is created in the mind of the pupil, and a subject so calculated to improve the reasoning powers, and give the habit of close thinking, is degraded by a dry and rigid course of instruction into an uninteresting exercise of the memory. To rise the curiosity, and to awaken the listless and dormant powers of younger minds should be the aim of every teacher; but where examples of excellence are wanting, the attempts to attain it are but few, while eminence excites attention and produces imitation. The object of this Work is to introduce a method of

teaching geometry, which has been much approved of by many scientific men in this country, as well as in France and America. The plan here adopted forcibly appeals to the eye, the most sensitive and the most comprehensive of our external organs, and its pre-eminence to imprint its subject on the mind is supported by the incontrovertible maxim expressed in the well known words of Horace:—

Segnius irritant animos demissa per aurem Quam quae sunt oculis subjecta fidelibus A feebler impress through the ear is made, Than what is by the faithful eye conveyed.

All language consists of representative signs, and those signs are the best which effect their purposes with the greatest precision and dispatch. Such for all common purposes are the audible signs called words, which are still considered as audible, whether addressed immediately to the ear, or through the medium of letters to the eye. Geometrical diagrams are not signs, but the materials of geometrical science, the object of which is to show the relative quantities of their parts by a process of reasoning called Demonstration. This reasoning has been generally carried on by words, letters, and black or uncoloured diagrams; but as the use of coloured symbols, signs, and diagrams in the linear arts and sciences, renders the process of reasoning more precise, and the attainment more expeditious, they have been in this instance accordingly adopted.

Such is the expedition of this enticing mode of communicating knowledge, that the Elements of Euclid can be acquired in less that one third of the time usually employed, and the retention by the memory is much more permanent; these facts have been ascertained by numerous experiments made by the inventor, and several others who have adopted his plans. The particulars of which are few and obvious; the letters annexed to points, lines, or other parts of a diagram are in fact but arbitrary names, and represent them in the demonstration; instead of these, the parts being differently coloured, are made to name themselves, for their forms in corresponding colours represent them in the demonstration.

In order to give a better idea of this system, and of advantages gained by its adoption, let us take a right angled triangle, and express some of its properties both by colours and the method generally employed.

## Some of the properties of the right angled triangle ABC, expressed by the method generally employed:

- 1. The angle BAC, together with the angles BCA and ABC are equal to two right angles, or twice the angle ABC.
- 2. The angle CAB added to the angle ACB will be equal to the angle ABC.
- 3. The angle ABC is greater than either of the angles BAC or BCA.

- 4. The angle BCA or the angle CAB is less than the angle ABC.
- 5. If from the angle ABC, there be taken the angle BAC, the remainder will be equal to the angle ACB.
- 6. The square of AC is equal to the sum of the squares of AB and BC.

The same properties expressed by colouring the different parts:

- A + A = 2 A = C.
  That is, the red angle added to the yellow angle added to the blue angle, equal twice the yellow angle, equal two right angles.
- $2. \quad \blacksquare + \blacktriangle = \bigstar.$

Or in words, the red angle added to the blue angle, equal the yellow angle.

3. > or > .

The yellow angle is greater than either the red or blue angle.

4.  $\checkmark$  or  $\checkmark$  <  $\checkmark$ .

Either the red or blue angle is less that the yellow angle.

5.  $\bigstar$  minus  $\bigstar$  =  $\checkmark$ . In other terms, the yellow angle made less be the blue angle equal red angle.

6.  $--2^2 = --2^2 + --2^2$ .

That is, the square of the yellow line is equal to the sum of the squares of the blue and red lines.

In oral demonstrations we gain with colours this important advantage, the eye and the ear can be addressed at the same moment, so that for teaching geometry, and other linear arts and sciences, in classes, the system is best ever proposed, this is apparent from the examples given.

Whence it is evident that a reference from the text to the diagram is more rapid and sure, by giving the forms and colours of the parts, or by naming the parts and their colours, than naming the parts and letters on the diagram. Besides the superior simplicity, this system is likewise conspicuous for concentration, and wholly excludes the injurious though prevalent practice of allowing the student to commit the demonstration to memory; until reason, and fact, and proof only make impressions of the understanding.

Again, when lecturing on the principles or properties of figures, if we mention the colour of the part or parts referred to, as in saying, the red angle, the blue line, or lines, &c, the part or parts thus named will be immediately seen by all the class at the same instant; not so if we say the angle ABC, the triangle PFQ, the figure EGKt, and so on; for the letters must be traced one by one before students arrange in their minds the particular magnitude referred to, which often occasions confusion and error, as well as loss of time. Also if the parts which are given as equal, have the same colours in any diagram, the mind will not wander from the object before it; that is, such an arrangement presents an ocular demonstration of the parts to be proved equal, and the learner retains the data throughout the whole of reasoning. But whatever may be the advantages of the present plan, if it be not substituted for, it can always be made a powerful auxiliary to the other methods, for the purpose of introduction, or of a more speedy reminiscence, or of more permanent retention by the memory.

The experience of all who have formed systems to impress facts on the understanding, agree in proving that coloured representations, as pictures, cuts, diagrams, &c. are more easily fixed in the mind than mere sentences unmarked by any peculiarity. Curious as it may appear, poets seem to be aware of this fact more than mathematicians; many modern poets allude to this visible system of communicating knowledge, one of them has thus expressed himself:

Sounds which address the ear are lost and die In one short hour, but these which strike the eye, Live long upon the mind, the faithful sight

Engraves the knowledge with a beam of light.

This perhaps may be reckoned the only improvement which plain geometry has received since the days of Euclid, and if there were any geometers of note before that time, Euclid's success has quite eclipsed their memory, and even occasioned all good things of that kind to be assigned to him; like Æsop among the writers of Fables. It may also be worthy of remark, as tangible diagrams afford the only medium through which geometry and other linear arts can be taught to the blind, the visible system is no less adapted to the exigencies of the deaf and dumb.

Care must be taken to show that colour has nothing to do with the lines, angles, or magnitudes, except merely to name them. A mathematical line, which is length without breadth, cannot possess colour, yet the junction of two colours on the same plane gives a good idea of what is meant by a mathematical line; recollect we are speaking familiarly, such a junction is to be understood and not the colour, when we say the black line, the red line or lines, &c.

Colours and coloured diagrams may at first appear a clumsy method to convey proper notions of the properties and parts of mathematical figures and magnitudes, however they will be found to afford a means more refined and extensive than any that has hitherto proposed.

We shall here define a point a line, and a surface, and demonstrate a proposition in order to show the truth of this assertion.

A point is that which has position, but not magnitude; or a point is position only, abstracted from the consideration of length, breadth, and thickness. Perhaps the following description is better calculated to explain the nature of mathematical point to those who have not acquired the idea, than the above specious definition. Let three colours meet and cover a portion of the paper, where they meet is not blue, nor is it yellow, nor is it red, as it occupies no portion of the plane, for if it did, it would belong to the blue, the red, or the yellow part; yet it exists, and has position without magnitude, so that with a little reflection, this junction of three colours on a plane, gives a good idea of a mathematical point.

A line is length without breadth. With the assistance of colours, nearly in the same manner as before, an idea of a line may be thus given:—

Let two colours meet and cover a portion of paper; where they meet is not red, nor is it blue; therefore the junction occupies no portion of the plane, and therefore it cannot have breadth, but only length: from which we can readily form an idea of what is meant by a mathematical line. For the purpose of illustration, one colour differing from the colour of the paper, or plane upon which it is drawn, would have been sufficient; hence in future, if we say the red line, the blue line or lines, &c. it is the junctions with the plane upon which they are drawn are to be understood.

Surface if that which has length and breadth without thickness.

When we consider a solid body (PQ), we perceive at once that it has three dimensions, namely :— length, breadth, and thickness; suppose one part of this solid (PS) to be red, and the other part (QR) yellow, and that the colours be distinct without commingling, the blue

surface (RS) which separates these parts, or which is the same thing, that which divides the solid without loss of material, must be without thickness, and only possesses length and breadth; this plainly appears from reasoning, similar to that just employed in defining, or rather describing a point and a line.

The proposition which we have selected to elucidate the manner in which the principles are applied, is the fifth of the first Book.

In an isosceles triangle ABC, the internal angles at the base ABC, ACB are equal, and when the sides AB, AC are produced, the external angles at the base BCE, CBD are also equal.

By annexing Letters to the Diagram.

Let the equal sides AB and AC be produced through the extremities BC, of the third side, and in the produced part BD of either, let any point D be assumed, and from the other let AE be cut off equal to AD (pr. 1.3). Let points E and D, so taken in the produced sides, be connected by straight lines DC and BE with the alternate extremities of the third side of the triangle.

In the triangles DAC and EAB the sides DA and AC are respectively equal to EA and AB, and the included angle A is common to both triangles. Hence (pr. 1.4) the line DC is equal to BE, the angle ADC to the angle AEB, and the angle ACD to the angle ABE; if from the equal lines AD and AE the equal sides AB and AC be taken, the remainders BD and CE will be equal. Hence in the triangles BDC and CEB, the sides BD and DC are respectively equal to CE and EB, and the angles D and E included by those sides are also equal. Hence (pr. 1.4) the angles DBC and ECB, which are those included by the third side BC and the productions of the equal sides AB and AC are equal. Also the angles DCB and EBC are equal if those equals be taken from the angles DCA and EBA before proved equal, the remainders, which are the angles ABC and ACB opposite to the equal sides, will be equal.

Therefore in an isosceles triangle, &c.

Our object in this place being to introduce system rather than to teach any particular set of propositions, we have therefore selected the foregoing out of the regular course. For schools and other public places of instruction, dyed chalks will answer to describe the diagrams, &c. for private use coloured pencils will be found very convenient.

We are happy to find that the Elements of Mathematics now forms a considerable part of every sound female education, therefore we call the attention to those interested or engaged in the education of ladies to this very attractive mode of communicating knowledge, and to the succeeding work for its future development.

We shall for the present conclude by observing, as the senses of sight and hearing can be so forcibly and instantaneously addressed alike with one thousand as with one, *the million* might be taught geometry and other branches of mathematics with great ease, this would advance the purpose of education more than any thing *might* be named, for it would teach the people how to think, and not what to think; it is in this particular the great error of education originates.

## Definitions

1 A *point* is that which has no parts.

2 A *line* is length without breadth.

3 The extremities of a line are points.

4

The straight or right line is that which lies evenly between its extremities.

5

A surface is that which has length and breadth only.

6

The extramities of a surface are lines.

7

A plane surface is that which lies evenly between its extremities.

#### 8

A plane angle is the inclination of two lines to one another, in a plane, which meet together, but are not in the same direction.

#### 9

A plane rectilinear angle is the inclination of two straight lines to one another, which meet together,

but are not in the same straight line.

When one straight line standing on another straight line makes the adjacent angles equal, each of these angles is called a *right angle*, and each of these lines is said to be *perpendicular* to one another.

#### 11

An obtuse angle is an angle greater than a right angle

12 An acute angle is an angle less than a right angle.

#### 13

A term or boundary is the extremity of any thing.

14

A figure is a surface enclosed on all sides by a line or lines.

#### 15

A circle is a plane figure, bounded by one continued line, called its circumference or periphery; and having a certain point within it, from which all straight lines drawn to its circumference are equal.

#### 16

This point (from which the equal lines are drawn) is called the centre of the circle.

#### 17

A diameter of a circle is a straight line drawn through the centre, terminated both ways in the circumference.

#### 18

A semicircle is the figure contained by the diameter, and the part of the circle cut off by the diameter.

#### 19

A segment of a circle is a figure contained by straight line and the part of the circumference which it cuts off.

#### 20

A figure contained by straight lines only, is called a rectilinear figure.

#### 21

A triangle is a rectilinear figure included by three sides.

#### 22

A quadrilateral figure is one which is bounded by four sides. The straight lines \_\_\_\_\_ and \_\_\_\_\_ connecting the vertices of the opposite angles of a quadrilateral figure, are called its diagonals.

#### 23

A polygon is a rectilinear figure bounded by more than four sides.

#### 24

A triangle whose sides are equal, is said to be equilateral.

A triangle which has only two sides equal is called an isosceles triangles.

25

26 A scalene triangle is one which has no two sides equal.

#### 27

#### 28

An obtuse angled triangle is that which has an obtuse angle.

#### 29

An acute angled triangle is that which has three acute angles.

#### 30

Of four-sided figures, a square is that which has all its sides equal, and all its angles right angles.

#### 31

A rhombus is that which has all its sides equal, but its angles are not right angles.

#### 32

An oblong is that which has all its angles right angles, but has not all its sides equal.

#### 33

A rhomboid is that which has its opposite sides equal to one another, but all its sides are not equal nor its angles right angles.

#### 34

All other quadrilateral figures are called trapeziums.

Parallel straight lines are such as are in the same plane, and which being produced continually in both directions would never meet.

35

## Postulates

I

Let it be granted that a straight line may be drawn from any one point to any other point.

Π

Let it be granted that a finite straight line may be produced to any length in a straight line.

III

Let it be granted that a circle may be described with any centre at any distance from that centre.

## Axioms

Ι

Magnitudes which are equal to the same are equal to each other.

#### Π

If equals be added to equals the sums will be equal.

#### III

If equals be taken away from equals the remainders will be equal.

#### IV

If equals be added to unequals the sums will be unequal.

#### V

If equals be taken away from unequals the remainders will be unequal.

#### VI

The doubles of the same or equal magnitudes are equal.

#### VII

The halves of the same or equal magnitudes are equal.

#### VIII

The magnitudes which coincide with one another, or exactly fill the same space, are equal.

#### IX

The whole is greater than its part.

#### Х

Two straight lines cannot include a space.

#### XI

All right angles are equal.

#### XII

If two straight lines ( ) meet a third straight line ( ) so as to make the two interior angles ( ) on the same side less than two straight angles, these two straight lines will meet if they be produced on that side on which the angles are less than two right angles.

## Elucidations

The twelfth axiom may be expressed in any of the following ways:

- 1. Two diverging straight lines cannot be both parallel to the same straight line.
- 2. If a straight line intersect one of the two parallel straight lines it must also intersect the other.
- Only one straight line can be drawn through a given point, parallel to a given straight line.
   Geometry has for its principal objects the exposi-

tion and explanation of the properties of *figure*, and figure is defined to be the relation which subsists between the boundaries of space. Space or magnitude is of three kinds, *linear*, *superficial*, and *solid*.

Angles might properly be considered as a fourth species of magnitude. Angular magnitude evidently consists of parts, and must therefore be admitted to be a species of quantity. The student must not suppose that the magnitude of an angle is affected by the length of the straight lines which include it and of whose mutual divergence it is the measure. The *vertex* of an angle is the point the *sides* of the *legs* of the angle meet, as A.

An angle is often designated by a single letter when its legs are the only lines which meet together at its vertex. Thus the red and blue lines form the yellow angle, which in other systems would be called angle A. But when more than two lines meet

in the same point, it was necessary by former methods, in order to avoid confusion, to employ three letters to designate an angle about that point, the letter which marked the vertex of the angle being always placed in the middle. Thus the black and red lines meeting together at C, form the blue angle, and has been usually denominated the angle FCD or DCF. The lines FC and CD are the legs of the angle; the point C is its vertex. In like manner the black angle would be designated the angle DCB or BCD. The red and blue angles added together, or the angle HCD added to FCD, make the angle HCD; and so of other angles.

When the legs of an angle are produced or prolonged beyond its vertex, the angles made by them on both sides of the vertex are said to be *vertically opposite* to each other: thus the red and yellow angles are said to be vertically opposite angles.

*Superposition* is the process by which one magnitude may be conceived to be placed upon another, so as exactly to cover it, or so that every part of each shall exactly coincide.

A line is said to be *produced*, when it is extended, prolonged, or it has length increased, and the increase of length which it receives is called *produced part*, or its *production*.

The entire length of the line or lines which enclose a figure, is called its *perimeter*. The first six books of Euclid treat of plain figures only. A line drawn from the centre of a circle to its circumference, is called a *radius*. That side of a right angled triangle, which is opposite to the right angle, is called the *hypotenuse*. An oblong is defined in the second book, and called a *rectangle*. All lines which considered in the first six books of the Elements are supposed to be in the same plane.

The *straight-edge* and *compasses* are the only instruments, the use of which is permitted in Euclid, or plain Geometry. To declare this restriction is the object of the postulated.

The *Axioms* of geometry are certain general propositions, the truth of which is taken to be self-evident and incapable of being established by demonstration.

*Propositions* are those results which are obtained in geometry by a process of reasoning. There are two species of propositions in geometry, *problems* and *theorems*.

A *Problem* is a proposition in which something is proposed to be done; as a line to be drawn under some given conditions, a circle to be described, some figure to be constructed, &c.

The *solution* of the problem consists in showing how the thing required may be done by the aid of the rule or straight-edge and compasses.

The *demonstration* consists in proving that the process indicated in the solution attains the required end.

A *Theorem* is a proposition in which the truth of some principle is asserted. This principle must be

deduced from the axioms and definitions, or other truths previously and independently established. To show this is the object of demonstration.

A *Problem* is analogous to a postulate.

A *Theorem* resembles an axiom.

A *Postulate* is a problem, the solution to which is assumed.

An *Axiom* is a theorem, the truth of which is granted without demonstration.

A *Corollary* is an inference deduced immediately from a proposition.

A *Scholium* is a note or observation on a proposition not containing an inference of sufficient importance to entitle it to the name of *corollary*.

A *Lemma* is a proposition merely introduced for the purpose of establishing some more important proposition.

## Symbols and abbreviations

- $\therefore$  expresses the word *therefore*.
- ☆ expresses the word *because*.

= expresses the word *equal*. This sign of equality may be read *equal to*, or *is equal to*, or *are equal to*; but the discrepancy in regard to the introduction of the auxiliary verbs *is*, *are*, &c. cannot affect the geometrical rigour.

 $\neq$  means the same as if the words `*not equal*' were written.

> signifies greater than.

< signifies *less than*.

 $\Rightarrow$  signifies not greater than.

 $\checkmark$  signifies not less than.

+ is read *plus (more)*, the sign of addition; when interposed between two or more magnitudes, signifies their sum.

 is read *minus* (*less*), signifies subtraction; and when placed between two quantities denotes that the latter is taken from the former.

× this sign expresses the product of two or more numbers when placed between them in arithmetic and algebra; but in geometry it is generally used to express a *rectangle*, when placed between "two straight lines which contain one if its right angles." A *rectangle* may also be represented by placing a point between two of its conterminous sides.

: ::: expresses an *analogy* or *proportion*; thus if A,

B, C and D represent four magnitudes, and A has to B the same ratio that C has to D, the proportion is thus briefly written

A:B::C:D, A:B=C:D, or  $\frac{A}{B}=\frac{C}{D}$ . This equality or sameness of ratio is read,

as A is to B, so is C to D;

or A is to B, as C is to D.

|| signifies parallel to.

 $\perp$  signifies *perpendicular* to.

 $\triangle$  signifies angle.

signifies right angle.

signifies two right angles.

▲ or ▲ briefly designates a point.

A square is described on a line is concisely written thus,  $---^2$ .

In the same manner twice the square of, is expressed by  $2 \cdot - 2^2$ .

def. signifies definition.

post. signifies postulate.

ax. signifies axiom.

hyp. signifies *hypothesis*. It may be necessary here to remark, that *hypothesis* is the condition assumed or taken for granted. Thus, the hypothesis of the proposition given in the Introduction, is that the triangle is isosceles, or that its legs are equal.

const. signifies *construction*. The *construction* is the change made in the original figure, by drawing lines, making angles, describing circles, &c. in order to adapt it to the argument of the demonstration or

the solution of the problem. The conditions under which these changes are made, are as indisputable as those contained in the hypothesis. For instance, if we make an angle equal to a given angle, these two angles are equal by construction.

Q. E. D. signifies *Quod erat demonstrandum*. Which was to be demonstrated.

## Book I

Prop. I. Prob.

ROM a given point (-------) to draw a straight line equal to a given straight line (-------).

Q. E. D.

F two triangles have two sides of the one

32

respectively equal to two sides of the other, to \_\_\_\_\_ and \_\_\_\_\_ to \_\_\_\_) and the angles (  $\checkmark$  and  $\checkmark$ ) contained by those equal sides also equal; then their bases or their sides ( and ———) are also equal: and the remaining angles opposite to equal sides are respectively equal ( harphi = harphi): and the triangles are equal in every and respect.

Let two triangles be conceived, to be so placed, that the vertex of one of the equal angles,  $\angle$  or  $\checkmark$ ; shall fall upon that of the other, and to coincide with \_\_\_\_\_, then will \_\_\_\_\_ coincide with —— if applied: consequently —— will coincide with ——, or two straight lines will enclose a space, which is impossible (ax. X), therefore

-, 🌶 = 🌶 and 🦲 = 🦲 , and as the triangles coincide, when and applied, they are equal in every respect. Q. E. D.

N any isosceles triangle  $\bigwedge$  if the equal sides be produced, the external angles at the base are equal, and the internal angles at the

base are also equal.

N any triangle ( ) if two angles ( ) and ) are equal, the sides ( ) and ) opposite to them are also equal.

For if the sides be not equal, let one of them \_\_\_\_\_\_, and from it to cut off \_\_\_\_\_\_ = \_\_\_\_ (pr. 1.3), draw \_\_\_\_\_.

Then in  $\bigwedge$  and  $\bigwedge$ , = (const.),  $\swarrow =$  (hyp.) and common,  $\therefore$  the triangles are equal (pr. 1.4) a part equal to the whole, which is absurd;  $\therefore$  neither of the sides  $\longrightarrow$  or  $\longrightarrow$  is greater than the other,  $\therefore$  hence they are equal.

Q. E. D.

N the same base ( ), and on the same side of it there can not be two triangles having their conterminous sides ( and and ) at both extremities of the

base, equal to each other.

When two triangles stand on the same base, and on the same side of it, the vertex of the one shall either fall outside of the other triangle, or within it; or, lastly, on one of its sides.

If it be possible let the two triangles be constructed so that  $\left\{ \begin{array}{c} & = & \\ & = & \\ & = & \end{array} \right\}$ , then draw ......... and,

therefore the two triangles cannot have their conterminous sides equal at both extremities of the base.

Q. E. D.

F two triangles have two sides of the one respectively equal to two sides of the other

= and = =

) and also their bases (----), equal; then the angles (----), equal; sides are also equal.

If the equal bases \_\_\_\_\_ and \_\_\_\_\_ be conceived to be placed one upon the other, so that the triangles shall lie at the same side of them, and that equal sides \_\_\_\_\_ and \_\_\_\_, \_\_\_ and \_\_\_\_\_ be conterminous, the vertex of the one must fall on the vertex of the other; for to suppose them not coincident would contradict the last proposition.

Therefore sides \_\_\_\_\_ and \_\_\_\_, being coincident with \_\_\_\_\_ and \_\_\_\_,  $\therefore \blacktriangle = \bigstar$ . Q. E. D.

36

ROM a given point (-------) in a given straight line (---------), to draw a perpendicular.

o draw a straight line perpendicular to a given indefinite straight line ( ) from a given point ( ) without.

With the given point  $\bigwedge$  as centre, at one side of the line, and any distance —— capable of extending to the other side, describe ——.

40

HEN a straight line ( ) standing upon another straight line ( ) makes angles with it; they are either two right angles or

together equal to two right angles.

line.

42

F two straight lines ( and —) same point, and at opposite sides of it, make with it adjacent angles (  $\frown$  and  $\land$ ) equal to two right angles; these straight lines lie in one continuous straight

In the same manner it may be shown that

NY two angles of a triangle  $\Delta$  are together less than two right angles.

and in the same manner it may be shown that any other two angles of the triangle taken together are less than two right angles.

## BOOK I PROP XVIII. THEOR.

55

56

F a straight line ( → ) meeting two other straight lines ( → and → ) makes with them the alternate angles ( ▲ and ▼; ▲ and ▲ ) equal, these two straight lines are parallel.

If <u>\_\_\_\_</u> be not parallel to <u>\_\_\_\_</u> they shall meet when produced.

If it be possible, let those lines be not parallel, but meet when produced; then the external angle is greater than (pr. 1.16), but they are also equal (hyp.), which is absurd: in the same manner it may be shown that they cannot meet on the other side;  $\therefore$  they are parallel.

straight lines ( and \_\_\_\_\_) makes the external equal to the internal and opposite angle, at the same side of the cutting line (namely

📔 = 🧖 or 📄 = 🤚 ), or if it makes two in-

ternal angles at the same side ( $\square$  and  $\bigtriangledown$ , or  $\square$ and () together equal to two right angles, those two straight lines are parallel.

58

STRAIGHT line ( ) falling on two parallel straight lines ( and ), makes the alternate angles equal to one an-

other; and also the external equal to the internal and opposite angle on the same side; and the two internal angles on the same side together equal to two right angles.

For if the alternate angles  $\checkmark$  and  $\blacktriangle$  be not equal, draw -, making  $\checkmark = \bigstar$  (pr. 1.23). Therefore - (pr. 1.27) and therefore two straight lines which intersect are parallel to the same straight line, which is impossible (ax. XII). Hence  $\checkmark$  and  $\bigstar$  are not unequal, that is, they are equal:  $\checkmark = \bigstar$  (pr. 1.15);  $\therefore \bigstar = \bigstar$ , the external angle equal to the internal and opposite on the same side: if  $\checkmark$  be added to both, then

+ = = (pr. 1.13). That is to

say, the two internal angles at the same side of the cutting line are equal to two right angles.

TRAIGHT lines ( \_\_\_\_\_ and \_\_\_\_) which are parallel to the same straight line ( \_\_\_\_\_), are parallel to one another.

Q. E. D.

ROM a given point **7** to draw a straight line parallel to a given straight line (<u>\_\_\_\_</u>).

of two internal and opposite angles (  $\land$  and  $\land$  ), and the three internal angles of any triangle taken together are equal to two right angles.

Q. E. D.

TRAIGHT lines ( — and — ) which join the adjacent extremities of two equal and parallel straight lines ( \_\_\_\_\_ and ......), are themselves parallel.

HE opposite sides and angles of any parallelogram are equal, and the diagonal ( ——— ) divides it into two equal parts.

Therefore the opposite sides and angles of the parallelogram are equal: and as the triangles  $\bigwedge$  and  $\bigvee$  are equal in every respect (pr. 1.4), the diagonal divides the parallelogram into two equal parts.

## Book 2

## Definition I

RECTANGLE or a right angled parallelogram is said to be contained by any two of its adjacent or conterminous sides.

## Definition II

N a parallelogram, the figure composed of one of the parallelograms about the diagonal, together with the two complements, is called a Gnomon.

HE rectangle contained by two straight lines, one of which is divided into any number of  $= \begin{cases} - & - & - \\ + & - & - & - \\ + &$ 

Draw -  $\perp$  - and = - (pr. 1.2, pr. 1.3); complete the parallelograms, that is to say,

Q. E. D.

F a straight line be divided into any two parts , the square of the whole line is equal to the sum of the rectangles contained by the whole line and each of its parts.

F a straight line be divided into any two parts , the rectangle contained by the whole line and either of its parts, is equal to

83

the square of that part, together with the rectangle under the parts.

Q. E. D.

F a straight line be divided into any two parts

F a straight line be divided —— into two equal parts and also **— —** into two unequal parts, the rectangle contained

by the unequal parts, together with the square of the line between the points of section, is equal to the square of half that line

Q. E. D.

F a straight line be bisected \_\_\_\_\_ and produced to any point \_\_\_\_\_, the rectangle contained by the whole line so in-

creased, and the part produced, together with the square of half the line, is equal to the square of the line made up of the half, and the produced part.

F a straight line be divided into any two parts , the squares of the whole line and one of the parts are equal to twice the rectangle contained by the whole line and that part, together with the square of the other parts.  $2^{2} + 2^{2} = 2^{2} + 2^{2} = 2^{2}$ 

F a straight line be divided into any two parts , the square of the sum of the whole line and any of its parts is equal to four times the rectangle contained by the whole line, and that part

together with the square of the other part.  $2^2 = 4 \cdot 2^2 + 2^2$ 

F a straight line be divided into two equal parts \_\_\_\_\_\_ and also into two unequal parts \_\_\_\_\_\_, the squares of the unequal parts are together double the squares of half the line, and of the part between the points of section. \_\_\_\_\_\_2 + \_\_\_2 = 2 \cdot \_\_\_2^2 + 2 \cdot \_\_2^2

Q. E. D.

F a straight line — be bisected and produced to any point ———, the squares of the whole produced line, and of the produced part, are together double of the squares of half line, and of the line made up of the half and produced part.  $-^{2} + -^{2} = 2 \cdot -^{2} + 2 \cdot -^{2}$ 

(pr. 1.5) = half right angle (pr. 1.32)  $\therefore$  = a right angle.

 $\blacktriangle = \bigstar = \triangleright = \bigtriangledown = \checkmark = \checkmark = half a right$ angle (pr. 1.5, pr. 1.32, pr. 1.29, pr. 1.34), and — = ····, — = ····· = — ···, (pr. 1.6, pr. 1.34).

Hence by (pr. 1.47)

$$= 2^{2} = \begin{cases} -2^{2} + 2^{2} \text{ or } -2^{2} \\ + 2^{2} = 2 \cdot 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2 \cdot 2^{2} + 2^{2} \\ + 2^{2} = 2^{2} + 2^{2} \\ + 2^{2} + 2^{2} \\ + 2^{2} + 2^{2} \\ + 2^{2} + 2^{2} \\ + 2^{2} + 2^{2} + 2^{2} \\ + 2^{2} + 2^{2} + 2^{2} \\ + 2^{2} + 2^{2} + 2^{2} + 2^{2} \\ + 2^{2} + 2^{2} + 2^{2} + 2^{2} \\ + 2^{2} + 2^{2} + 2^{2} + 2^{2} \\ + 2^{2} + 2^{2$$

 $----^2$ 

0 divide a given straight line ——— in such a manner, that the rectangle contained by the whole line and one of its parts may be equal to the square of the other.

 $\therefore$  — 2

Q. E. D.

N any obtuse angled triangle, the square of the side subtending the obtuse angle exceeds the sum of the squares of the sides contain-

ing the obtuse angle, by twice the rectangle contained by either of these sides and the produced parts of the same from the obtuse angle to the perpendicular let fall on it from the opposite acute angle.

 $2 > 2^2 + 2^2 + 2^2$  by  $2 \cdot 2^2 + 2^2$ 

N any triangle, the square of the side subtending an acute angle, is less than the sum of the squares of the sides containing that angle,

93

by twice the rectangle contained by either of these sides, and the part of it intercepted between the foot of the perpendicular let fall on it from the opposite angle, and the angular point of the acute angle.

First.

 $\frac{1}{2} < \frac{1}{2} + \frac{1}{2} by 2 \cdot \frac{1}{2} \cdot$ 

First, suppose the perpendicular to fall within the triangle, then (pr. 2.7)  $-\cdots^2 + -^2 = 2 \cdot -\cdots \cdot - + \cdots^2$ add to each --2 then,  $- \cdots^2 + - 2^2 + - 2^2 = 2 \cdot - \cdots \cdot - + \cdots^2 + - 2^2$ ∴ (pr. 1.47)  $- - - - 2 = 2 \cdot - - - 2$ and :  $-2^2 < -2^2 + -2^2 = 2^2 + 2^2 + 2^2 = 2^2 = 2^2 + 2^2 = 2^2 = 2^2 + 2^2 = 2^2 = 2^2 + 2^2 = 2^2 = 2^2 = 2^2 + 2^2 = 2^2 = 2^2 = 2^2 + 2^2 = 2$ Next suppose the perpendicular to fall without the triangle, then (pr. 2.7)  $- \cdots^2 + -^2 = 2 \cdot - \cdots \cdot - + \cdots^2$ add to each --2 then  $- \cdots^2 + - 2^2 + - 2^2 = 2 \cdot - \cdots \cdot - + \cdots^2 + - 2^2$ : (pr. 1.47)  $----+-^2=2\cdot----\cdot-^2+---^2.$  $\therefore - 2^2 < - 2^2 + 2^2 \operatorname{by} 2 \cdot - 2^2 \operatorname{by}$ Q. E. D.

### 1 Equal circles are those whose diameters are equal.

2

A right line is said to touch a circle when it meets the circle, and being produced does not cut it.

3

Circles are said to touch one another which meet, but do not cut one another.

#### 4

Right lines are said to be equally distant from the centre of a circle when the perpendiculars drawn to them from the centre are equal.

5

And the straight line on which the greater perpendicular falls is said to be farther from the centre.

6 A segment of a circle is the figure contained by a straight line and the part of the circumference it cuts off.

#### 7

An angle of a segment is that contained by a straight line and a circumference of a circle.

#### 8

An angle in a segment is the angle contained by two straight lines drawn from any point in the circumference of the segment to the extremities of the straight line which is the base of the segment.

#### 9

An angle is said to stand on the part of the circumference, or the arch, intercepted between the right lines that contain the angle.

#### 10

A sector of a circle is the figure contained by two radii and the arch between them.

#### 11

Similar segments of circles are those, which contain equal angles.

#### 12

Circles which have the same centre are called *concentric circles*.

0 find the centre of a given circle

Draw within the circle any straight line ———, make —— = ——, draw —  $\perp$  ———; bisect ——, and the point of bisection is the centre. For, if it be possible, let any other point as the point of concourse of ——, —— and —— be the centre.

 $\mathbf{\nabla} = \mathbf{\nabla}$  (ax. XI) which is absurd; therefore the assumed point is not the centre of the circle; and in the same manner it can be proved that no other point which is not on —— is the centre, therefore the centre is in ——, and therefore the point where —— is bisected is the centre.

centre, it is perpendicular to it; or, if perpendicular to it, it bisects it.

Q. E. D.

#### BOOK III PROP. IV. THEOR.

100

F in a circle two straight lines cut one another, which do not both pass through the centre, they do not bisect one another.

If one of the lines pass through the centre, it is evident that it cannot be bisected by the other, which does not pass through the centre.

But if neither of the lines —— or —— pass through the centre, draw ……… from the centre to their intersection.

F two circles intersect

they have

not the same centre.

Suppose it possible that two intersecting circles have a common centre; from such supposed centre draw \_\_\_\_\_\_ to the intersecting point, and \_\_\_\_\_\_ meeting the circumferences of the circles.

Then 
$$---- = ---- (def. 15)$$
  
and  $---- = ---- (def. 15)$ 

a part equal to the whole, which is absurd:

 $\therefore$  circles supposed to intersect in any point cannot have the same centre.

F two circles touch one another internally, they have not the same centre.

For, if it be possible, let both circles have the same centre; from such a supposed centre draw ....., and \_\_\_\_\_\_ to the point of contact.

Then ---- = ---- (def. 15)and ---- = ---- (def. 15) $\therefore ----- = -----;$ 

a part equal to the whole, which is absurd; therefore the assumed point is not the centre of both circles, and in the same manner it can be demonstrated that no other point is.

F from any point within a circle

which is not the centre, lines { are drawn to the circumference; the greatest of those lines is that ( ........) which passes through the centre, and the least is the remaining part ( ........) of the diameter. Of the others, that ( ...........) which is nearer to the line passing through the centre, is greater than that ( .............) which is more remote.

Fig. 2. The two lines ( — — and — ) which make equal angles with that passing through the centre, on opposite sides of it, are equal to each other; and there cannot be drawn a third line equal to them, from the same point to the circumference.

### Figure I.

To the centre of the circle draw and and the circle draw and the circle draw and the circumstance of the

(pr. 1.24) and may in like manner to be proved greater than any other line drawn from the same point to the circumference more remote from —......

 $\therefore$  — = — ; and no other line is equal to — drawn from the same point to the circumference; for if it were nearer to the one passing through the centre it would be greater, and if it were more remote it would be less.

HE original text of this proposition is here divided into three parts.

#### I.

If from a point without a circle, straight lines  $\{ \begin{array}{c} \hline \\ \hline \\ \hline \\ \hline \\ \end{array} \}$  are drawn to the circumference; of those falling upon the concave circumference the greatest is that (------) which passes through the centre, and the line (------) which is nearer the greatest is greater than that (------) which is more remote.

Draw ……… and …… to the centre. Then, —…… which passes through the centre, is greatest; for since ……… = ………, if — be added to both — …… = — + ………; but > — (pr. 1.20) ∴ — is greater than any other line drawn from the same point to the concave circumference.

II.

Of those lines falling on the convex circumference the least (•••••••) which being produced would pass through the centre, and the line which is nearer to least is less than that which is more remote.

#### III.

 $\therefore \quad \dots \quad = \quad (pr. 1.4)$ But  $= \quad \dots \quad ;$   $\therefore \quad \dots \quad = \quad \dots \quad , \text{ which is absurd.}$   $\therefore \quad \dots \quad \text{ is not } = \quad \dots \quad , \text{ nor to any part of } \quad \dots \quad is not > \quad \dots \quad .$ Neither is  $\dots \quad > \quad \dots \quad , \text{ nor to any part of } \quad \dots \quad .$ 

they are  $\therefore$  = to each other.

And any other line drawn from the same point to the circumference must lie at the same side with one of these lines, and be more or less remote than it from the line passing through the centre, and cannot therefore be equal to it.

F a point be taken within a circle O, from which more than two equal straight lines (------, -----) can be

drawn to the circumference, that point must be the centre of the circle.

For if it be supposed that the point in which more than two equal straight lines meet is not the centre, some other point — must be; join these two points by — and produce it both ways to the circumference.

Then since more than two equal straight lines are drawn from a point which is not the centre, to the circumference, two of them at least must lie at the same side of the diameter ———; and since from a point  $\land$ , which is not the centre, straight lines are drawn to the circumference; the greatest is ———, which passes through the centre: and —— which is nearer to ———, > —— which is more remote (pr. 3.8); but —— = —— (hyp.) which is absurd.

The same may be demonstrated of any other point, different from  $\bigwedge$ , which must be the centre of the circle.

For if it be possible, let it intersect in three points; from the centre of  $\bigcirc$  draw -, and - to the points of intersection;  $\therefore -$  = - = - (def. 15), but as the circles intersect, they have not the same centre (pr. 3.5):

 $\therefore$  the assumed point is not the centre of  $\bigcirc$ , and  $\therefore$  as  $\bigcirc$ ,  $\bigcirc$  and  $\bigcirc$  from a point not the centre, they are not equal (pr. 3.7, pr. 3.8); but it was shown before that they were equal, which is absurd; the circles therefore do not intersect in three points.

110

F two circles ( ) and touch one another internally, the right line joining their centres, being produced, shall pass through a point of contact.

> For, if it be possible, let — join their centres, and produce it both ways; from a point of contact draw ----- to the centre of ( and from the same point of contact

draw •••••• to the centre of

The centres are not therefore so placed, that a line joining them can pass through any point but a point of contact.

of contact.

If it be possible, let \_\_\_\_\_ joining the centres, and not pass through a point of contact; then from a point of contact draw \_\_\_\_\_ and \_\_\_\_ to the centres.

greater than whole, which is absurd.

The centres are not therefore so placed that the line joining them can pass through any point but the point of contact.

#### 112 BOOK III PROP. XIII. THEOR.

NE circle cannot touch another, either externally or internally, in more points than one

draw and , But = (def. 15),  $\therefore$  if = be added to both, = = + =; but = (def. 15), and  $\therefore$  + = =; but  $\therefore$  + = =; but  $\therefore$  (pr. 1.20), which is absurd.

## Figure II.

But if the points of contact be the extremities of the right line joining the centres, this straight line must be bisected in two different points for the two centres; because it is the diameter of both circles, which is absurd.

Figure III.

Next, if it be possible, let and touch externally in two points; draw \_\_\_\_\_\_ joining the centres of the circles, and passing through one of the points of contact, and draw \_\_\_\_\_\_ and \_\_\_\_.

$$= - - (def. 15);$$
  
and 
$$= - - (def. 15);$$
  
$$\therefore - + - = - ;;$$
  
but 
$$- + - - = - ;;$$
  
$$(pr. 1.20), which is absurd.$$

There is therefore no case in which two circles can touch one another in two points.

#### 114 BOOK III PROP. XIV. THEOR.

QUAL straight lines ( ) inscribed in a circle are equally distant from the centre; and also, straight lines equally distant from

the centre are equal.

Also, if the lines — and — be equally distant from the centre; that is to say, if the perpendiculars … and … be given equal, then

For, as in the preceding case,  $2^{2} + \frac{2}{2} = \frac{2}{2} + \frac{2}{2}$ but  $2^{2} = \frac{2}{2}$ 

 $\therefore$  \_\_\_\_\_ = \_\_\_\_, and the doubles of these \_\_\_\_\_ are also equal.

#### 116 BOOK III PROP. XV. THEOR.

HE diameter is the greatest straight line in a circle: and, of all others, that which is nearest to the centre is greater than the more remote.

Again, the line which is nearer the centre is greater than the one more remote.

First, let the given lines be <u>and</u> and <u>which are at the same side of the centre and do not intersect;</u>

Figure II. Let the given lines be \_\_\_\_\_ and \_\_\_\_ which either are at different sides of the centre, or intersect; from the centre draw \_\_\_\_\_ and \_\_\_\_\_  $\perp$  \_\_\_\_\_ \_\_\_\_\_ and \_\_\_\_\_, make \_\_\_\_\_ = \_\_\_\_, and draw \_\_\_\_\_  $\perp$  \_\_\_\_\_, Since \_\_\_\_\_ and \_\_\_\_\_ are equally distant from the centre, \_\_\_\_\_ = \_\_\_\_ (pr. 3.14); but \_\_\_\_\_ > \_\_\_\_ (pr. 3.15),  $\dot{\ldots}$  \_\_\_\_\_\_.

HE straight line <u>drawn</u> from the extremity of the diameter <u></u> of the circle perpendicular to it falls without the circle

And if any straight line **.....** by drawn from a point within that perpendicular to the point of contact, it cuts the circle.

Part I. If it be possible, let \_\_\_\_\_, which meets the circle again, be  $\perp$  \_\_\_\_\_, and draw \_\_\_\_\_.

Then, because ----,

🗲 = 🔻 (pr. 1.5),

and  $\therefore$  each of these angles is acute (pr. 1.17)

but  $\triangleleft$  =  $\frown$  (hyp.), which is absurd,

therefore --- drawn  $\perp$  --- does not meet the circle again.

## Part II.

Let \_\_\_\_\_ be  $\perp$  \_\_\_\_\_ and let \_\_\_\_\_ be drawn from a point \_\_\_\_\_ between \_\_\_\_\_ and the circle, which, if it be possible, does not cut the circle.

> Because  $\mathbf{a} = \mathbf{a},$   $\therefore \mathbf{b}$  is an acute angle; suppose  $\cdots \mathbf{a}$ , drawn from the centre of the circle, it must fall at the side of  $\mathbf{b}$  the acute angle.

 $\therefore \triangleright \text{ which is supposed to}$ be a right angle is >  $\triangleright,$  $\therefore ---> \cdots;$ but -----;

and  $\therefore$  ........., a part greater than the whole, which is absurd. Therefore the point does not fall outside the circle, and therefore the straight line ....... cuts the circle.

O draw a tangent to a given circle O from a given point, either in or outside of its circumference.

If a given point be in the circumference, as at , it is plain that the straight line  $\_\_\_$  ⊥ the radius, will be required tangent (pr. 3.16).

But if the given point , be outside of the circumference,

draw ••••• from it to the centre, cutting (); and draw  $\cdots$   $\perp$ describe ( concentric with  $\bigcap$  radius = -----, draw •••••• to the centre from the point where **.....** falls on ( circumference, draw ---  $\perp$  ---- from the point where it cuts (), Then —— will be the tangent required. For in and \_ \_\_\_\_ 💧 common, and  $\cdots = \cdots$  $\therefore$  (pr. 1.4) = (-) = (-),  $\therefore$  is a tangent to  $\bigcap$ . Q. E. D.

F a straight line **.....** be a tangent to a circle, the straight line **....** drawn from the centre to the point of contact, is perpendicular to it.

and in the same manner it can be demonstrated, that no other line except —— is perpendicular to ……….

F a straight line —— be a tangent to a circle, the straight line \_\_\_\_\_, drawn perpendicular to it from point of the contact, passes through the centre of the circle.

For, if it be possible, let the centre be without , and draw ..... from the supposed centre to the point of contact.

> Because ..... (pr. 3.18)  $\therefore$  =  $\square$ , a right angle; but  $\checkmark$  =  $\checkmark$  (hyp.), and  $\therefore = 4$ , a part equal

to the whole, which is absurd.

Therefore the assumed point is not the centre; and in the same manner it can be demonstrated, Q. E. D.

HE angle at the centre of a circle is double the angle at the circumference, when they have the same part of the circumference for their base.

Figure II. Let the centre be within  $\checkmark$ , the angle at the circumference; draw — from the angular point through the centre of the circle; then  $\checkmark = \checkmark$ , and  $\checkmark = \checkmark$ , because of the equality of the sides (pr. 1.5). Hence  $\checkmark + \checkmark + \checkmark + \checkmark = twice \checkmark$ . But  $\checkmark = \checkmark + \checkmark$ , and  $\triangleright = \checkmark + \checkmark$ ,  $\therefore \checkmark = twice \checkmark$ .

HE angles in the same segment of a circle are equal.

#### 126 BOOK III PROP. XXII. THEOR.

HE opposite angles  $\checkmark$  and  $\checkmark$ ,  $\diamondsuit$  and  $\diamond$  of any quadrilateral figure inscribed in a circle, are together equal to two right angles. Draw — and — the diagonals; and because angles in the same segment are equal  $\checkmark = \diamond$ , and  $\checkmark = \checkmark$ ;

In like manner it may be shown that,

PON the same straight line, and upon the same side of it, two similar segments of circles cannot be constructed, which do not coincide.

therefore no point in either of the segments falls without the other, and therefore the segments coincide.

#### 128 BOOK III PROP. XXIV. THEOR.

and the similar segments being then upon the same straight line and at the same side of it, must also coincide (pr. 3.23), and are therefore equal.

SEGMENT of a circle being given, to describe the circle of which it is the segment.

From any point in the segment draw \_\_\_\_\_ and \_\_\_\_, bisect them, and from the points of bisection draw \_\_\_\_\_  $\perp$  \_\_\_\_ and \_\_\_\_  $\perp$  \_\_\_\_

where they meet is the centre of the circle.

Because — terminated in the circle is bisected perpendicularly by — , it passes through the centre (pr. 3.1), likewise — passes through the centre, therefore the centre is in the intersection of these perpendiculars.

If therefore the equal segments be taken from the equal circles, the remaining segments will be equal;

But if the given equal angles be at the circumference, it is evident that the angles at the centre, being double of those at the circumference, are also equal, and therefore the arcs on which they stand are equal.

circumferences.

 $\cdot\cdot$  neither angle is greater than the other,

and  $\therefore$  they are equal.

Q. E. D.

### 132 BOOK III PROP. XXVIII. THEOR.

Q. E. D.

If the equal arcs be semicircles the proposition is evident. But if not,

but these are the chords subtending the equal arcs.

Q. E. D.

#### 134

N a circle the angle in a semicircle is a right angle, the angle in a segment greater than a semicircle is acute, and the angle in a segment

less than a semicircle is obtuse.

Figure III. The angle in a segment less than a semicircle is obtuse. Take in the opposite circumference any point, to which draw and . Because + = 1 (pr. 3.22) but - < 1 (figure II.),  $\therefore$  is obtuse.

F a straight line be a tangent to a circle, and from the point of contact a right line be drawn cutting the circle, the angle made by this line with the tangent is equal to the angle in the alternate segment of the circle.

If the chord should pass through the centre, it is evident the angles are equal, for each of them is a right angle. (pr. 3.16, pr. 3.31)

But if not, draw  $\_\_\_$  from the point of contact, it must pass through the centre of the circle, (pr. 3.19)

N a given straight line - to describe a segment of a circle that shall contain an angle equal to a given angle  $\square$ ,  $\square$ ,  $\Delta$ .

If a given angle be a right angle, bisect the given line, and describe a semicircle on it, this will evidently contain a right angle. (pr. 3.31)

If the given angle be acute or obtuse, make with the given line, at its extremity,

F two chords { \_\_\_\_\_} in a circle intersect each other, the rectangle contained by the segments of the one is equal to the rectangle contained by the segments of the other.

## Figure I.

If the given right lines pass through the centre, they are bisected in the point of intersection, hence the rectangles under their segments are squares of their halves, and therefore equal.

Figure II. Let **"\_\_\_\_\_** pass through the centre, and — mot; draw — and —. Then  $- \times \cdots = -^2 - \cdots^2$ (pr. 2.6), or  $- \times \cdots = \cdots ^{2} - \cdots ^{2}$ .  $\therefore - \times \cdots = \cdots - \times - (\text{pr. 2.5}).$ 

## Figure III.

Let neither of the given lines pass through the centre, draw through their intersection a diameter ·····,

F from a point without a circle two straight lines be drawn to it, one of which ----is a tangent to the circle, and the other cuts it; the rectangle under the whole cut-

ting line ———— and the external segment —— is equal to the square of the tangent ——.

## Figure I.

Let \_\_\_\_\_ pass through the centre;

draw — from the centre to the point of contact;

 $2^{2} = 2^{2} \text{ minus } 2^{2} \text{ (pr. 1.47),}$ or  $--2^2 = --2^2 \text{ minus } -2^2$ .  $\therefore$  \_\_\_\_2 = \_\_\_\_ × \_\_\_ (pr. 2.6).

Figure II.

If ..... do not pass through the centre, draw ..... and ....... Then  $\longrightarrow 2$  minus  $\longrightarrow 2$ (pr. 2.6), that is,  $\cdots = -^2 \text{ minus } -^2$ . 

Q. E. D.

#### 142 BOOK III PROP. XXXVII. THEOR.

F from a point outside of a circle two straight lines be drawn, the one **——** cutting the circle, the other —— meeting it, and if the rectangle contained by the whole cutting line **-----** and its external segment **-----** be equal to

the square of the line meeting the circle, the latter is a tangent to the circle.

### 3

A rectilinear figure is said to be *inscribed in* a circle, when the vertex of each angle of the figure is in the circumference of the circle.

### 4

A rectilinear figure is said to be *circumscribed about* a circle, when each of its sides is tangent to the circle.

5 A circle is said to be *inscribed in* a rectilinear figure, when each side of the figure is a tangent to the circle.

6

A circle is said to be *circumscribed about* a rectilinear figure, when the circumference passes through the vertex of each angle of the figure.

is circumscribed.

## 7

A straight line is said to be *inscribed in* a circle, when its extremities are in the circumference.

The Fourth Book of the Elements is devoted to the solution of problems, chiefly relating to the inscription and circumscription of regular polygons and circles.

A regular polygon is one whose angles and sides are equal.

146

and therefore the triangle inscribed in the circle is equiangular to the given one.

BOUT a given circle to circumscribe a triangle equiangular to a given triangle.

from the centre of the given circle draw ——, any radius.

At the extremities of the radii draw \_\_\_\_\_, \_\_\_\_, and \_\_\_\_\_, tangents to the given circle. (pr. 3.17)

In the same manner it can be demonstrated that

$$\Delta = \Delta;$$

 $\therefore \Delta = \Delta$  (pr. 1.32)

and therefore the triangle circumscribed about the given circle is equiangular to the given triangle.

hence with any of these lines as radius, describe

······· = ······· = ·······;

O and it will pass through the extremities of the other two; and the sides of the given triangle, being perpendicular to the three radii at their extremities, touch the circle (pr. 3.16), which is therefore inscribed in the given triangle.

0 describe a circle about a given triangle.

From the points of bisection draw — and  $\perp$  and — respectively (pr. 1.11), and from their point of concourse draw —, and — and describe a circle with any one of them, and it will be the circle required.

In like manner it may be shown that ----= ------.

Draw the two diameters of the circle  $\perp$  to each other, and draw \_\_\_\_\_, \_\_\_\_, and

For, since  $\bigcirc$  and  $\bigcirc$  are, each of them, in a semicircle, they are right angles (pr. 3.31),

∴ \_\_\_\_ || \_\_\_\_ (pr. 1.28):

and in like manner ——— || ———.

And because  $\frown$  =  $\frown$  (const.),

and •••••• = •••••• (def. 15).

∴ —— = —— (pr. 1.4);

and since the adjacent sides and angles of the

BOUT a given circle O to circumscribe a square.

Draw two diameters of the given circle perpendicular to each other, and through their extremities draw \_\_\_\_\_, \_\_\_\_, \_\_\_\_ and \_\_\_\_\_ tangents to the circle;

and therefore if a circle be described from the concourse of these lines with any of them as radius, it will be inscribed in the given square. (pr. 3.16) Q. E. D.

If from the confluence of these lines with any one of them as radius, a circle be described, it will circumscribe the given square.

0 construct an isosceles triangle, in which each of the angles at the base shall be double of the vertical angle.

156

and consequently each angle at the base is double of the vertical angle.

N a given circle to inscribe an equilateral and equiangular pentagon.

Construct an isosceles triangle, in which each of the angles at the base shall be double of the angle at the vertex, and inscribe in the given circle a triangle

equiangular to it (pr. 4.2);

Because each of the angles  $\nearrow$ ,  $\checkmark$ ,  $\bigstar$ ,  $\bigstar$ , and  $\checkmark$  are equal, the arcs upon which they stand are equal (pr. 3.26); and  $\div$  \_\_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, and \_\_\_\_\_ which subtend these arcs are equal (pr. 3.29) and  $\div$  the pentagon is equilateral, it is also equiangular, as each of its angles stand upon equal arcs (pr. 3.27).

158

0 describe an equilateral pentagon about a given circle .

Draw five tangents through the vertices of the angles of any regular pentagon inscribed in the

given circle (pr. 3.17).

These five tangents will form the required pentagon.

 $\therefore$  — twice —;

In the same manner it can be demonstrated

In the same manner it can be demonstrated that the other sides are equal, and therefore the pentagon is equilateral, it is also equiangular, for

in the same manner it can be demonstrated that the other angles of the descried pentagon are equal. O. E. D. 160

O inscribe a circle in a given equiangular and equilateral pentagon.

Let be a given equiangular and equilateral pentagon; it is required to inscribe a circle in it.

In like manner it may be demonstrated that  $\bigotimes$  is bisected by ....., and that the remaining angle of polygon is bisected in a similar manner.

In the same way it may be shown that the five perpendiculars on the sides of the pentagon are equal to one another.

Describe with any one of the perpendiculars as radius, and it will be the inscribed circle required. For if it does not touch the sides of the pentagon, but cut them, then a line drawn from the extremity at right angles to the diameter of a circle will fall within the circle, which has been shown to be absurd. (pr. 3.16)

162

0 describe a circle about a given equilateral and equiangular pentagon.

Therefore if a circle be described from the point where these five lines meet, with any one of them as a radius, it will circumscribe the given pentagon. Q. E. D.

o inscribe an equilateral and equiangular
hexagon in a given circle

From any point in the circumference of the given circle describe passing through its centre, and draw the diameters \_\_\_\_\_, \_\_\_\_ and ; draw ....., ...., ...., &c. and the required hexagon is inscribed in the given circle. Since — passes through the centres of the are equilateral triangles, and circles 🖪 = > = one-third of ( pr. 1.32)hence but = (pr. 1.13);  $\therefore$   $\blacksquare$  =  $\blacktriangleright$  =  $\blacksquare$  = one-third of  $\square$ (pr. 1.32), and the angles vertically opposite to these are all equal to one another (pr. 1.15), and stand on equal arches (pr. 3.26), which are subtended by equal chords (pr. 3.29); and since each of the angles of the hexagon is double of the angle of an equilateral

triangle, it is also equiangular.

0 inscribe a circle in an equilateral and equiangular quindecagon in a given circle.

Let \_\_\_\_\_ and \_\_\_\_ be the sides of an equilateral pentagon inscribed in the given circle, and \_\_\_\_\_ the side of an inscribed equilateral triangle.

The arc subtended by \_\_\_\_\_ and \_\_\_\_  $\Big\} = \frac{2}{5} = \frac{6}{15} \begin{cases} \text{of the whole} \\ \text{circumference} \end{cases}$ The arc subtended by \_\_\_\_\_  $\Big\} = \frac{1}{3} = \frac{5}{15} \begin{cases} \text{of the whole} \\ \text{circumference} \end{cases}$ Their difference =  $\frac{1}{15}$ 

:. the arc subtended by  $\cdots = \frac{1}{15}$  difference of the whole circumference.

Hence if straight lines equal to ••••••• be placed in the circle (pr. 4.1), an equilateral and equiangular quindecagon will be thus inscribed in the circle.

### 2

A greater magnitude is said to be multiple of a less, when the greater is measured be the less; that is, when the greater contains the less a certain number of times exactly.

#### 3

Ratio is the relation which one quantity bears to another of the same kind, with respect to magnitude.

#### 4

Magnitudes are said to have a ratio to one another, when they are of the same kind, and the one which is not the greater can be multiplied so as to exceed the other.

The other definitions will be given throughout the book where their aid is first required.

## Axioms

Ι

Equimultiples or equisubmultiples of the same, or of equal magnitudes, are equal.

If 
$$A = B$$
, then  
twice  $A =$  twice  $B$ ,  
that is,  $2A = 2B$ ;  
 $3A = 3B$ ;  
 $4A = 4B$ ;  
&c. &c.  
and  $\frac{1}{2}$  of  $A = \frac{1}{2}$  of  $B$ ;  
 $\frac{1}{3}$  of  $A = \frac{1}{3}$  of  $B$ ;  
 $\frac{1}{4}$  of  $A = \frac{1}{4}$  of  $B$ ;  
&c. &c.

Π

A multiple of a greater magnitude is greater than the same multiple of a less.

Let 
$$A > B$$
,  
then  $2A > 2B$ ;  
 $3A > 3B$ ;  
 $4A > 4B$ ;  
&c. &c.

#### III

That magnitude, of which a multiple is greater than the same multiple of another, is greater than the other.

> Let 2A > 2B, then A > B; or, let 3A > 3B, then A > B; or, let mA > mB, then A > B.

F any number of magnitudes be equimultiples of as many others, each of each: what multiple soever any one of the first of its part, the

same multiple shall of the first magnitudes taken together be of all the others taken together.

Let  $\bigcirc$   $\bigcirc$   $\bigcirc$   $\bigcirc$   $\bigcirc$  be the same multiple of  $\bigcirc$ , that  $\bigcirc$   $\bigcirc$   $\bigcirc$   $\bigcirc$   $\bigcirc$  is of  $\bigcirc$ , that  $\bigcirc$   $\bigcirc$   $\bigcirc$   $\bigcirc$  is of  $\bigcirc$ .

because there are as many magnitudes

The same demonstration holds in any number of magnitudes, which has here been applied to three. .: If any number of magnitudes, &c.

F the first magnitude be the same multiple of the second that the third of the fourth, and the fifth the same multiple of the second that

169

the sixth is of the fourth, then shall the first, together with the fifth, be the same multiple of the second that the third, together with the sixth, is of the fourth.

Let  $\bullet \bullet \bullet$ , the first, be the same multiple of  $\bullet$ , the second, that  $\bigcirc \bigcirc \bigcirc \bigcirc$ , the third, is of  $\bigcirc$ , the fourth; and let  $\bullet \bullet \bullet \bullet$ , the fifth, be the same multiple of  $\bullet$ , the second, that  $\bigcirc \bigcirc \bigcirc \bigcirc$ , the sixth, is of  $\bigcirc$ , the fourth.

Then it is evident that  $\left\{ \begin{array}{c} \bullet \bullet \bullet \bullet \\ \bullet \bullet \bullet \bullet \end{array} \right\}$ , the first and fifth together, is the same multiple of  $\bullet$ , the second, that  $\left\{ \begin{array}{c} \bullet \bullet \bullet \bullet \\ \circ \bullet \bullet \bullet \end{array} \right\}$ , the third and sixth together, is of the same multiple of  $\diamond$ , the fourth; because there are as many magnitudes in  $\left\{ \begin{array}{c} \bullet \bullet \bullet \bullet \\ \bullet \bullet \bullet \bullet \end{array} \right\} = \bullet$  as there are in  $\left\{ \begin{array}{c} \bullet \bullet \bullet \bullet \\ \bullet \bullet \bullet \bullet \end{array} \right\} = \bullet$ .  $\diamond$ . If the first magnitude, &c.

F the first of four magnitudes be the same multiple of the second that the third is to the fourth, and if any equimultiples whatever of

the first and third be taken, those shall be equimultiples; one of the second, and the other of the fourth.

The same reasoning is applicable in all cases.

 $\therefore$  If the first of four, &c.

### Definition V.

Four magnitudes,  $\bigcirc$ ,  $\bigcirc$ ,  $\diamondsuit$ ,  $\bigtriangledown$ ,  $\bigtriangledown$ , are said to be proportionals when every equimultiple of the first and third be taken, and every equimultiple of the second and fourth, as

Then taking every pair of equimultiples of the first and third, and every pair of equimultiples of the second and fourth,

That is, if twice the first be greater, equal or less than twice the second, twice the third will be greater, equal, or less than twice the fourth; or, if twice the first be greater, equal, or less than three times the second, twice the third will be greater, equal, or less than three times the fourth, and so on, as above expressed.

In other terms, if three times the first be greater, equal, or less than twice the second, three times the third will be greater, equal, or less than twice the fourth; or, if three times the first be greater, equal, or less than three times the second, then will three times the third be greater, equal, or less than three times the fourth; or if three times the first be greater, equal, or less than four times the second, then will three times the third be greater, equal, or less than four times the fourth, and so on. Again,

And so on, with any other equimultiples of the four magnitudes, taken in the same manner.

Euclid expresses this definition as follows :-

The first of four magnitudes is said to have the same ratio to the second, which the third has to the fourth, when equimultiples whatsoever of the first and third being taken, and any equimultiples whatsoever of the second and fourth; if the multiple of the first be less than that of the second, and the multiple of the third is also less than that of the fourth; or, if the multiple of the first be equal to that of the second, the multiple of the third is also equal to that of the fourth; or, if the multiple of the first be greater than that of the second, the multiple of the third is also greater than that of the fourth.

In future we shall express this definition generally, thus:

If  $M \bullet >$ , = or  $< m \blacksquare$ , when  $M \diamond >$ , = or  $< m \blacktriangledown$ ,

Then we infer that  $\bigcirc$ , the first, has the same ratio to  $\bigcirc$ , the second, which  $\diamondsuit$ , the third, has to  $\bigtriangledown$  the fourth; expressed in the succeeding demonstrations thus:

That is, if the first be to the second, as the third is to the fourth; then if M times the first be greater than, equal to, or less than m times the second, then shall M times third be greater than, equal to, or less than m times the fourth, in which M and m are not to be considered particular multiples, but every pair of multiples whatever; nor are such marks as  $\bigcirc$ ,  $\bigtriangledown$ ,  $\blacksquare$ , &c. to be considered any more than representa-

tives of geometrical magnitudes.

The student should throughly understand this definition before proceeding further.

F the first of four magnitudes have the same ratio to the second, which the third has to the fourth, then any equimultiples whatever of

the first and third shall have the same ratio to any equimultiples of the second and fourth; viz., the equimultiple of the first shall have the same ratio to that of the second, which the equimultiple of the third has to that of the fourth.

Let  $\bullet$  :  $\blacksquare$  ::  $\blacklozenge$  :  $\diamondsuit$ , then  $3 \bullet$  :  $2 \blacksquare$  ::  $3 \diamondsuit$  :  $2 \blacktriangledown$ , every equimultiple of  $3 \bullet$  and  $3 \diamondsuit$  are equimultiples of  $\bullet$  and  $\diamondsuit$ , and every equimultiple of  $2 \blacksquare$  and  $2 \blacktriangledown$ , are equimultiples of  $\blacksquare$  and  $\blacktriangledown$  (pr. 5.3)

That is, M times  $3 \bullet$  and M times  $3 \bullet$  are equimultiples of  $\bullet$  and  $\blacklozenge$ , and m times  $2 \blacksquare$  and  $m2 \checkmark$ are equimultiples of  $2 \blacksquare$  and  $2 \checkmark$ ; but  $\bullet : \blacksquare ::$  $\bullet : \blacktriangledown$  (hyp.);  $\therefore$  if  $M3 \bullet <, =,$  or  $> m2 \blacksquare$ , then  $M3 \bullet <, =,$  or  $> m2 \blacktriangledown$  (def. 5.5) and therefore  $3 \bullet : 2 \blacksquare :: 3 \bullet : 2 \blacktriangledown$  (def. 5.5)

The same reasoning holds good if any other equimultiple of the first and third be taken, any other equimultiple of the second and fourth.

 $\therefore$  If the first four magnitudes, &c.

F one magnitude be the same multiple of another, which a magnitude taken from the first is of a magnitude taken from the other, the

remainder shall be the same multiple of the remainder, that the whole is of the whole.

F two magnitudes be equimultiples of two others, and if equimultiples of these be taken from the first two, the remainders are either

equal to these others, or equimultiples of them.

Hence, (M' minus m') and (M' minus m')are equimultiples of  $\blacksquare$  and  $\blacktriangle$ , and equal to  $\blacksquare$  and  $\blacktriangle$ , when M' minus m' = 1.

∴ If two magnitudes be equimultiples, &c.

F the first of the four magnitudes has the same ratio to the second which the third has to the fourth, then if the first be greater than

the second, the third is also greater than the fourth; and if equal, equal; if less, less.

 $\therefore$  If the first of four, &c.

## Definition XIV

Geometricians make use of the technical term "Invertendo," by inversion, when there are four proportionals, and it is inferred, that the second is to the first as the fourth to the third.

Let A : B :: C : D, then, by "invertendo" it is inferred B : A :: D : C

F four magnitudes are proportionals, they are proportionals also when taken inversely.

 $\therefore$  If four magnitudes, &c.

F the first be the same multiple of the second, or be the same part of it, that the third is of the fourth; the first is to the second, as the

third is to the fourth.

 $\therefore$  If the first be the same multiple, &c.

F the first be to the second as the third to the fourth, and if the first be a multiple, or a part of the second; the third is the same multiple, or the same part of the fourth.

184

 $\therefore$  if the first be to the second, &c.

QUAL magnitudes have the same ratio to the same magnitude, and the same has the same ratio to equal magnitudes.

From the foregoing reasoning it is evident that,

if m > = or  $< M \bullet$ , then m > = or  $< M \bullet$  $\therefore = : \bullet = : \cdot \bullet$  (def. 5.5).

∴ Equal magnitudes, &c.

### Definition VII.

When of the equimultiples of four magnitudes (taken as in the fifth definition), the multiple of the first is greater than that of the second, but multiple of the third is not greater than the multiple of the fourth, then the first is said to have to the second a greater ratio than the third magnitude has to the fourth: and, on the contrary, the third is said to have to the fourth a less ratio than the first has to the second.

This definition will in future be expressed thus :--

then  $\blacksquare$  :  $\bigcirc$  >  $\blacksquare$  :  $\diamondsuit$ .

In the above general expression, M' and m' are to be considered particular multiples, not like the multiples M and m introduced in the fifth definition, which are in that definition considered to be every pair of multiples that can be taken. It must also be here observed, that  $\checkmark$ ,  $\bigcirc$ ,  $\blacksquare$ , and like symbols are to be considered merely the representatives of geometrical magnitudes.

In a partial arithmetical way, this may be set forth as follows:

First	Second	Third	Fourth
8	7	10	9
16	14	20	18
24	21	30	27
32	28	40	36
40	35	50	45
48	42	60	54
56	49	70	63
64	56	80	72
72	63	90	81
80	70	100	90
88	77	110	99
96	84	120	108
104	91	130	117
112	98	140	126
&c.	&с.	&c.	&с.

Let us take the four numbers 8, 7, 10, and 9.

Among the above multiples we find 16 > 14 and 20 > 18; that is, twice the first is greater than twice

188

the second, and twice the third is greater than twice the fourth; and 16 < 21 and 20 < 27; that is, twice the first is less than three times the second, and twice the third is less than three times the fourth: and among the same multiples we can find 72 > 56and 90 > 72; that is, 9 times the first is greater than 8 times the second, and 9 times the third is greater than 8 times the fourth. Many other equimultiples might be selected, which would tend to show that the numbers 8, 7, 10, and 9 were proportionals, but they are not, for we can find multiple of the first >a multiple of the second, but the same multiple of the third that has been taken of the first, not > the same multiple of the fourth which has been taken to the second; for instance, 9 times the first is > 10times the second, but 9 times the third is not > 10times the fourth, that is 72 > 70, but 90 not > 90, or 8 times the first we find > 9 times the second, but 8 times the third is not greater than 9 times the fourth, that is, 64 > 63, but 80 not > 81. When any such multiples as these can be found, the first (8) is said to have the second (7) a greater ratio than the third (10) has to the fourth (9), and on the contrary the third (10) is said to have to the fourth (9) a less ratio than the first (8) has to the second (7).

F unequal magnitudes the greater has a greater ratio to the same than the less has: and the same magnitude has a greater ratio to the less than it has to the greater.

Let **\_\_\_\_** and **\_\_\_\_** be two unequal magnitudes, and **o** any other. We shall first prove that which is greater of the two unequal magnitudes, has a greater ratio to • than [, the less, has to [; that is, [ : [ > : •: take  $M' \blacksquare$ ,  $m' \bullet$ ,  $M' \blacksquare$ ,  $m' \bullet$ ; such that  $M' \blacktriangle$  and  $M' \blacksquare$  shall be each  $> \bigcirc$ ; also take  $m' \bullet$  the least multiple of  $\bullet$ , which will make  $m' \bullet > M' = M' = M'$ ;  $\therefore M'$  is not  $> m' \bullet$ , but M' is  $> m' \bullet$ , for, as  $m' \bullet$  is the first multiple which first becomes > M', than (m' minus 1)or  $m' \bullet$  minus  $\bullet$  is not >  $M' \bullet$ ,  $\therefore m' \bullet \text{ minus } \bullet + \bullet \text{ must be } < M' \bullet + M' \bullet;$ that is,  $m' \bullet$  must be  $< M' \blacksquare$ ;  $\therefore M'$  is  $> m' \odot$ ; but it has been shown above that M' is not  $> m' \bigcirc$ ,

 $\therefore$  Of unequal magnitudes, &c.

The contrivance employed in this proposition for finding among the multiples taken, as in the fifth definition, a multiple of the first greater than the multiple of the second, but the same multiple of the third which has been taken of the first, not greater than the same multiple of the fourth which has been taken of the second, may be illustrated numerically as follows :—

The number 9 has a greater ratio to 7 than 8 has to 7: that is, 9:7 > 8:7; or 8 + 1:7 > 8:7.

The multiple of 1, which first becomes greater than 7, is 8 times, therefore, we may multiply the first and third by 8, 9, 10, or any other greater number; in this case, let us multiply the first and third by 8, and we have 64 + 8 and 64: again, the first multiple of 7 which becomes greater than 64 is 10 times; then, by multiplying the second and fourth by 10, we shall have 70 and 70; then, arranging these multiples, we have—

Consequently 64 + 8, or 72, is greater than 70, but 64 is not greater than 70,  $\therefore$  by the seventh definition 9 has a greater ratio to 7 than 8 has to 7.

The above is merely illustrative of the foregoing demonstration, for this property could be shown of these or other numbers very readily in the following manner; because, if an antecedent contains its consequent a greater number of times than another antecedent contains its consequent, or when a fraction is formed of an antecedent for the numerator, and its consequent for the denominator be greater than another fraction which is formed of another antecedent for the numerator and its consequent for the denominator, the ratio of the first antecedent to its consequent is greater than the ratio of the last antecedent to its consequent.

Thus, the number 9 has a greater ratio to 7, than 8 has to 7, for  $\frac{9}{7}$  is greater than  $\frac{8}{7}$ .

Again, 17 : 19 is a greater ratio than 13 : 15, because  $\frac{17}{19} = \frac{17 \times 15}{19 \times 15} = \frac{255}{185}$ , and  $\frac{13}{15} = \frac{13 \times 19}{15 \times 19} = \frac{247}{185}$ , hence it is evident that  $\frac{255}{185}$  is greater than  $\frac{247}{185}$ ,  $\therefore \frac{17}{19}$  is greater than  $\frac{13}{15}$ , and, according to what has been above shown, 17 has to 19 a greater ratio than 13 has to 15.

So that the general terms upon which a greater, equal, or less ratio exists are as follows :—

If  $\frac{A}{B}$  be greater than  $\frac{C}{D}$ , A is said to have to B a greater ratio than C has to D; if  $\frac{A}{B}$  be equal to  $\frac{C}{D}$ , then A has to B the same ratio which C has to D; and if  $\frac{A}{B}$  be less to  $\frac{C}{D}$ , A is said to have to B a less ratio than C has to D.

The student should understand all up to this proposition perfectly before proceeding further, in order fully to comprehend the following propositions of this book. We therefore strongly recommend the learner to commence again, and read up to this slowly, and carefully reason at each step, as he proceeds, particularly guarding against the mischievous system of depending wholly on the memory. By following these instructions, he will find that the parts which usually present considerable difficulties will present no difficulties whatever, in prosecuting the study of this important book.

AGNITUDES which have the same ratio to the same magnitude are equal to one another; and those to which the same magnitude has

the same ratio are equal to one another.

 $\therefore$  Magnitudes which have the same ratio, &c.

This may be shown otherwise, as follows :--

Let A : B = A : C, then B = C, for, as the fraction  $\frac{A}{B}$  = the fraction  $\frac{A}{C}$ , and the numerator of one equal to the numerator of the other, therefore, denominators of these fractions are equal, that is B = C.

Again, if B : A = C : A, B = C. For, as  $\frac{B}{A} = \frac{C}{A}$ , B must = C.

HAT magnitude which has a greater ratio than another has unto the same magnitude, is the greater of the two; and that magnitude

to which the same has a greater ratio than it has unto another magnitude, is the less of the two.

Let  $\bigtriangledown$  :  $\blacksquare > \bigoplus$  :  $\blacksquare$ , then  $\bigtriangledown > \bigoplus$ . For if not, let  $\mathbf{\nabla} = \text{or } < \mathbf{\Theta}$ ; then,  $\bigtriangledown$  :  $\blacksquare$  =  $\bigcirc$  :  $\blacksquare$  (pr. 5.7) or ▼ : < < ● : (pr. 5.8) and (invert.), which is absurd according to the hypothesis.  $\therefore$  v is not = or <  $\bigcirc$ , and  $\therefore$   $\blacksquare$  must be  $> \blacksquare$ . Again, let  $\blacksquare$  :  $\bigcirc$  >  $\blacksquare$  :  $\bigtriangledown$ , then,  $\bullet < \mathbf{\nabla}$ . For if not,  $\bigcirc$  must be > or =  $\bigtriangledown$ , Then  $\blacksquare$  :  $\bigcirc$  <  $\blacksquare$  :  $\bigtriangledown$  (pr. 5.8) and (invert.); or = : • = = : • (pr. 5.7), which is absurd (hyp.);  $\therefore \bullet$  is not > or =  $\bigtriangledown$ . and  $\therefore \bullet$  must be  $< \bigtriangledown$ .

 $\therefore$  That magnitude which has, &c.

ATIOS that are the same to the same ratio, are same to each other.

 $\therefore$  Ratios that are the same &c.

F any number of magnitudes be proportionals, as one of the antecedents is to its consequent, so shall all the antecedents taken together be

to all the consequents.

In the same way it may be shown, if M times one of the antecedents be equal to or less than m times one of the consequents, M times all the antecedents taken together, will be equal to or less than m times all the consequents taken together. Therefore, by the fifth definition, as one of the antecedents is to its consequent, so are all the antecedents taken together to all the consequents taken together.

∴ If any number of magnitudes, &c.

F the first has to the second the same ratio which the third has to the fourth, but the third to the fourth a greater ratio than the

fifth has to the sixth; the first shall also have to the second a greater ratio than the fifth to the sixth.

Let  $\bigtriangledown$  :  $\bigcirc$  =  $\blacksquare$  :  $\diamondsuit$ , but  $\blacksquare$  :  $\diamondsuit$  >  $\diamondsuit$  :  $\bigcirc$ , then  $\bigtriangledown$  :  $\bigcirc$  >  $\circlearrowright$  :  $\bigcirc$ For, because  $\blacksquare$  :  $\blacklozenge$  >  $\diamondsuit$  :  $\bigcirc$ , there are some multiples (M' and m') of **and**  $\diamond$ , and of  $\diamond$  and  $\bullet$ , such that  $M' > m' \diamond$ , but  $M' \diamondsuit$  not  $> m' \bullet$ , by the seventh definition. Let these multiples be taken, and take the same multiples of  $\bigtriangledown$  and  $\bigcirc$ .  $\therefore$  (def. 5.5) if  $M' \bigtriangledown >, =, \text{ or } < m' \bigcirc$ ; then will  $M' > = >, =, \text{ or } < m' \diamond$ , but  $M' > m' \Leftrightarrow$  (construction);  $\therefore M' \bigtriangledown > m' \bigcirc$ . but  $M' \diamondsuit$  is not  $> m' \blacksquare$  (construction); and therefore by the seventh definition,  $\blacksquare$  :  $\square$  >  $\bigcirc$  :  $\blacksquare$ 

 $\therefore$  If the first has to the second, &c.

F the first has the same ratio to the second which the third has to the fourth; then, if the first be greater than the third, the second

shall be greater than the fourth; and if equal, equal; and if less, less.

Let  $\P$  :  $\bigcirc$  ::  $\blacksquare$  :  $\blacklozenge$ , and first suppose  $\blacksquare$  >  $\blacksquare$ , then will  $\bigcirc$  >  $\blacklozenge$ . For  $\P$  :  $\bigcirc$  >  $\blacksquare$  :  $\bigcirc$  (pr. 5.8), and by the hypothesis  $\P$  :  $\bigcirc$  =  $\blacksquare$  :  $\diamondsuit$ ;  $\therefore$   $\blacksquare$  :  $\diamondsuit$  >  $\blacksquare$  :  $\bigcirc$  (pr. 5.13),  $\therefore$   $\diamondsuit$  <  $\bigcirc$  (pr. 5.10), or  $\bigcirc$  >  $\diamondsuit$ . Secondly, let  $\P$  =  $\blacksquare$ , then will  $\bigcirc$  =  $\diamondsuit$ . For  $\P$  :  $\bigcirc$  =  $\blacksquare$  :  $\bigcirc$  (pr. 5.7), and  $\P$  :  $\bigcirc$  =  $\blacksquare$  :  $\diamondsuit$  (hyp.);  $\therefore$   $\blacksquare$  :  $\bigcirc$  =  $\blacksquare$  :  $\diamondsuit$  (pr. 5.11), and  $\therefore$   $\bigcirc$  =  $\diamondsuit$  (pr. 5.9). Thirdly, if  $\P$  <  $\blacksquare$ , then will  $\bigcirc$  <  $\diamondsuit$ ; because  $\blacksquare$  >  $\P$  and  $\blacksquare$  :  $\blacklozenge$  =  $\P$  :  $\bigcirc$ ;  $\therefore$   $\diamondsuit$  >  $\bigcirc$ , by the first case, that is,  $\bigcirc$  <  $\diamondsuit$ .

 $\therefore$  If the first has the same ratio, &c.

AGNITUDES have the same ratio to one another which their equimultiples have.

 $\therefore$  Magnitudes have the same ratio, &c.

#### Definition XIII

The technical term permutando, or alternando, by permutation or alternately, is used when there are four proportionals, and it is inferred that the first has the same ratio to the third which the second has to the fourth; or that the first is to the third as the second to the fourth: as is shown in the following proposition :—

Let  $\bigcirc$  :  $\blacklozenge$  ::  $\blacktriangledown$  :  $\blacksquare$ , by "permutando" or "alternando" it is inferred  $\bigcirc$  :  $\blacktriangledown$  :  $\blacklozenge$  :  $\blacksquare$ .

It may be necessary here to remark that the magnitudes  $\bigcirc$ ,  $\blacklozenge$ ,  $\blacktriangledown$ ,  $\blacksquare$ , must be homogeneous, that is, of the same nature or similitude of kind; we must therefore, in such cases, compare lines with lines, surfaces with surfaces, solids with solids, &c. Hence the student will readily perceive that a line and a surface, a surface and a solid, or other heterogenous magnitudes, can never stand in the relation of antecedent and consequent.

F four magnitudes of the same kind be proportionals, they are also proportionals when taken alternately.

Let  $\P$  :  $\square$  ::  $\blacksquare$  :  $\blacklozenge$ , then  $\P$  :  $\blacksquare$  ::  $\square$  :  $\diamondsuit$ . For  $M \P$  :  $M \square$  ::  $\P$  :  $\square$  :  $\square$  (pr. 5.15), and  $M \P$  :  $M \square$  ::  $\blacksquare$  :  $\diamondsuit$  (hyp.) and (pr. 5.11); also m :  $m \blacklozenge$  ::  $\blacksquare$  :  $\diamondsuit$  (pr. 5.15);  $\therefore M \P$  :  $M \square$  :: m  $\blacksquare$  :  $m \diamondsuit$  (pr. 5.14), and  $\therefore$  if  $M \P$  >, = or < m  $\blacksquare$ , then will  $M \square$  >, =, or  $< m \blacklozenge$  (pr. 5.14); therefore, by the fifth definition,  $\P$  :  $\blacksquare$  ::  $\square$  :  $\diamondsuit$  :

 $\therefore$  If four magnitudes of the same kind, &c.

## **Definition XVI**

Dividendo, by definition, when there are four proportionals, and it is inferred, that the excess of the first above the second is to the second as the excess of the third above the fourth is to the fourth.

> Let A : B :: C : D; by "dividendo" it is inferred A minus B : B :: C minus D : D.

According to the above, A is supposed to be greater than B, and C greater than D; if this be not the case, but to have B greater than A, and D greater than C, B and D can be made to stand as antecedents, and A and C as consequents, by "invertion"

B : A :: D : C;then, by "dividendo," we infer *B* minus *A* : *A* :: *D* minus *C* : *C* 

F magnitudes, taken jointly, be proportionals, they shall also be proportionals when taken separately: that is, if two magnitudes

together have to one of them the same ratio which two others have to one of these, the remaining one of the first two shall have to the other the same ratio which the remaining one of the last two has to the other of these.

Let  $\mathbf{\nabla}$  +  $\mathbf{\nabla}$  :  $\mathbf{\nabla}$  ::  $\mathbf{\Box}$  +  $\mathbf{\diamond}$  :  $\mathbf{\diamond}$ ,

then will  $\checkmark$  :  $\bigcirc$  ::  $\bigcirc$  :  $\diamondsuit$ . Take  $\checkmark > m \bigcirc$  to each add  $M \bigcirc$ , then we have  $M \blacktriangledown + M \bigcirc > m \bigcirc + M \bigcirc$ , or  $M(\blacktriangledown + \bigcirc) > (m + M) \bigcirc$ : but because  $\blacktriangledown + \bigcirc$  :  $\bigcirc$  ::  $\blacksquare + \diamondsuit$  :  $\diamondsuit$  (hyp.), and  $M(\blacktriangledown + \bigcirc) > (m + M) \bigcirc$ ;  $\therefore M(\blacksquare + \diamondsuit) > (m + M) \diamondsuit$  (def. 5.5);  $\therefore M \blacksquare + M \diamondsuit > m \diamondsuit + M \diamondsuit$ ;  $\therefore M \blacksquare > m \diamondsuit$ , by taking  $M \diamondsuit$  from both sides: that is, when  $M \blacktriangledown > m \bigcirc$ , then  $M \blacksquare > m \diamondsuit$ . In the same manner it may be

proved, that if  $M \checkmark = \text{ or } < m \bigcirc$ , then will  $M \blacksquare = \text{ or } < m \diamondsuit$ ; and  $\therefore \blacktriangledown : \bigcirc :: \blacksquare : \diamondsuit \text{ (def. 5.5)}$ 

∴ If magnitudes taken jointly, &c.

## Definition XV

The term componendo, by composition, is used when there are four proportionals; and it is inferred that the first together with the second is to the second as the third together with the fourth is to fourth.

Let A : B :: C : D;

then, by term "componendo," it is inferred that  $A + B \, : \, B \, :: \, \frac{C}{D} + D \, : \, D$ 

By "invertion" B and D may become the first and the third, and A and C the second and fourth, as

B: A :: D : C,

then, by "componendo," we infer that B + A : A :: D + C : C.

F magnitudes, taken separately, be proportionals, they shall also be proportionals taken jointly: that is, if the first be to the second as

the third is to the fourth, the first and second together shall be to the second as the third and fourth together is to the fourth.

 $\therefore$  If magnitudes, taken separately, &c.

F a whole magnitude be to a whole, as a magnitude taken from the first is to a magnitude taken from the other; the remainder shall be

to the reminder, as the whole to the whole.

 $\therefore$  If a whole magnitude be to a whole, &c.

### **Definition XVII**

The term "convertendo," by conversion, is made use of by geometricians, when there are four proportionals, and it is inferred, that the first is to its excess above the second, as the third is to its excess above the fourth. See the following proposition :—

F four magnitudes be proportionals, they are also proportionals by conversion: that is, the first is to its excess above the second, as the

third is to its excess above the fourth.

 $\therefore$  If four magnitudes, &c.

# **Definition XVIII**

"Ex æquali" (sc. distantia), or ex æquo, from equality of distance: when there is any number of magnitudes more than two, and as many others, such that they are proportionals when taken two and two of each rank, and it is inferred that the first is to the last of the first rank of magnitudes, as the first is to the last of the others: "of this there are two following kinds, which arise from different order in which the magnitudes are taken, two and two."

208

#### **Definition XIX**

"Ex æquali," from equality. This term is used simply by itself, when the first magnitude is to the second of the first rank, as the first to the second of the other rank; and as the second to the third of the first rank, so is the second to the third of the other; and so in order: and the inference is as mentioned in the preceding definition; whence this is called ordinate proposition. It is demonstrated in pr. 5.22.

Thus, if there be two ranks of magnitudes, A, B, C, D, E, F, the first rank, and L, M, N, O, P, Q, the second, such that A : B :: L : M, B : C :: M : B, C : D :: N : O, D : E :: O : P, E : F :: P : Q; we infer by the term "ex æquali" that A : F :: L : Q

## Definition XX

"Ex æquali in proportione perturbata seu inordinata," from equality in perturbate, or disorderly proposition. This term is used when the first magnitude is to the second of the first rank as the last but one is to the last of the second rank; and as the second is to the third of the first rank, so is the last but two to the last but one of the second rank; and as the third is to the fourth of the first rank, so is the third from the last to the last but two of the second rank; and so on in order: and the inference is in the 18th definition. It is demonstrated in pr. 5.23.

Thus, if there be two ranks of magnitudes,

A, B, C, D, E, F, the first rank, and L, M, N, O, P, Q, the second, such that A : B :: P : Q, B : C :: O : P, C : D :: N : O, D : E :: M : N, E : F :: L : M; the term "ex æquali in proportione perturbata seu inordinata" infers that A : F :: L : Q

F there be three magnitudes, and the other three, which taken two and two, have the same ratio; then, if the first be greater than

the third, the fourth shall be greater than the sixth; and if equal, equal; and if less, less.

Let  $\bigtriangledown$ ,  $\bigcirc$ ,  $\blacksquare$ , the first three magnitudes, and  $\diamondsuit$ ,  $\bigcirc$ ,  $\bigcirc$ , be the other three, such that  $\bigtriangledown$  :  $\bigcirc$  ::  $\diamondsuit$  :  $\diamondsuit$ , and  $\bigcirc$  :  $\blacksquare$  ::  $\diamondsuit$  :  $\diamondsuit$ , Then, if  $\heartsuit$  >, =, or <  $\blacksquare$ , then will  $\diamondsuit$  >, =, or <  $\blacksquare$ . From the hypothesis, by alternando, we have  $\bigcirc$  :  $\diamondsuit$  ::  $\bigcirc$  ::  $\bigcirc$  :  $\diamondsuit$ , and  $\bigcirc$  :  $\diamondsuit$  ::  $\bigcirc$  ::  $\boxdot$  :  $\diamondsuit$ ,

: if  $\bigtriangledown$  >,=, or <  $\blacksquare$ , then will  $\diamondsuit$  >,=, or <  $\bigcirc$  (pr. 5.14).

 $\therefore$  If there be three magnitudes, &c.

F there be three magnitudes, and other three, which have the same ratio, taken two and two, but in a cross order; then if the first magni-

tude be greater than the third, the fourth shall be greater than the sixth; and if equal, equal, and if less, less.

 $\therefore$  If there be three, &c.

F there be any number of magnitudes, and as many others, which, taken two and two in order, have the same ratio; the first shall have

to the last of the first magnitudes the same ratio which the first of the others has to the last of the same.

N.B.— This is usually cited by the words "ex æquali," or "ex æquo."

Let these magnitudes, as well as any equimultiples whatever of the antecedents and consequents of the ratios, stand as follows :—

 $\therefore$  if  $M \checkmark >,=$  or < Nthen will  $M \blacklozenge > = \text{ or } < N \circlearrowright$ , by (pr. 5.20), and ∴ ♥ : ■ :: ♦ : ● (def. 5.5). Next, let there be four magnitudes,  $\bigtriangledown$ ,  $\blacklozenge$ ,  $\blacklozenge$ ,  $\blacklozenge$ , and other four,  $\Diamond$ ,  $\bigcirc$ ,  $\blacksquare$ ,  $\blacksquare$ ,  $\blacktriangle$ , which, taken two and two, have the same ratio, that is to say,  $\bigtriangledown$  :  $\diamondsuit$  ::  $\diamondsuit$  :  $\diamondsuit$ , ◆ : ■ :: ● : ■. and  $\blacksquare$  :  $\blacklozenge$  ::  $\blacksquare$  :  $\blacktriangle$ , then shall  $\bigtriangledown$  :  $\diamondsuit$  ::  $\diamondsuit$  :  $\bigstar$ : for, because  $\bigtriangledown$ ,  $\blacklozenge$ ,  $\blacksquare$ , are three magnitudes, and  $\diamond$ ,  $\bullet$ ,  $\blacksquare$ , other three, which, taken two and two, have the same ratio; therefore, by foregoing case  $\bigtriangledown$  :  $\blacksquare$  ::  $\diamondsuit$  :  $\blacksquare$ , but : • :: • : •; therefore, again, by the first case, ▼ : ◆ :: ◇ : ▲; and so on, whatever number of magnitudes be.

 $\therefore$  If there be any number, &c.

F there be any number of magnitudes, and as many others, which, taken two and two in a cross order, have the same ratio; the first

shall have to the last of the first magnitudes the same ratio which the first of the others has to the last of the same.

N.B.— This is usually cited by the words "ex æquali in proportione perturbata;" or "ex æquo perturbato."

First, let there be magnitudes ♥, ♥, ♥, ■, and other three, ♦, ◊, ●, which, taken two and two in a cross order, have the same ratio;

> that is,  $\bigtriangledown$  :  $\bigcirc$  ::  $\diamondsuit$  :  $\diamondsuit$ , and  $\bigcirc$  :  $\blacksquare$  ::  $\diamondsuit$  :  $\diamondsuit$ , then shall  $\bigtriangledown$  :  $\blacksquare$  ::  $\diamondsuit$  :  $\diamondsuit$ .

Let these magnitudes and their respective equimultiples be arranged as follows :—
$M \blacksquare, M \bigcup, m \bigcup$ . and other three  $M \diamondsuit, m \diamondsuit, m \diamondsuit$ which, taken two and two in a cross order, have the same ratio: therefore, if M > =, or < mthen will  $M \diamond >, =, \text{ or } < m \bullet$  (pr. 5.21), and ∴ ♥ : ■ :: ♦ : ♦ (def. 5.5). Next, let there be four magnitudes, ♥, ♥, ■, ♦, and other four, ♦, ●, ■, ▲, which, when taken two and two in a cross order, have the same ratio; namely,  $\mathbf{-}$  :  $\mathbf{-}$  ::  $\mathbf{-}$  :  $\mathbf{-}$ , □ : ■ :: ● : ■, and **=** :  $\diamond$  ::  $\diamond$  : **•**, then shall  $\blacksquare$  :  $\diamond$  ::  $\diamond$  :  $\bullet$ . For, because  $\bigtriangledown$ ,  $\bigcirc$ , are three magnitudes, and  $\bigcirc$ ,  $\blacksquare$ ,  $\bigstar$ , other three, which, taken two and two in a cross order have the same ratio, therefore, by the first case,  $\bigtriangledown$  :  $\blacksquare$  ::  $\blacklozenge$  :  $\blacklozenge$ , but **:** • :: **:** • :, therefore again, by the first case, ■ : ◆ :: ◇ : ●; and so on, whatever be the number of such magnitudes.  $\therefore$  If there be any number, &c.

F the first has to the second the same ratio which the third has to the fourth, and the fifth to the second the same which the sixth has to

the fourth, the first and fifth together shall have to the second the same ratio which the third and sixth together have to the fourth.

F four magnitudes of the same kind are proportionals, the greatest and least of them together are greater than other two together.

Let four magnitudes,  $\mathbf{V}$  +  $\mathbf{O}$ ,  $\mathbf{M}$  +  $\mathbf{O}$ ,  $\mathbf{O}$ , and  $\mathbf{O}$ , of the same kind be proportionals, that is to say,

→ + □ : ■ + ◆ :: □ : ◆,
 and let ♥ + □ be the greatest of the four, and
 consequently by pr. 5.A and pr. 5.14, ◆ is the least;
 then will ♥ + □ + ◆ be > ■ + ◆ + □;
 because ♥ + □ : ■ + ◆ :: □ : ◆,
 ∴ ♥ : ■ :: ♥ + □ : ■ + ◆ (pr. 5.19),
 but ♥ + □ > ■ + ◆ (hyp.),
 ∴ ♥ > ■ (pr. 5.A);
 to each of these add □ + ◆,

∴ If four magnitudes, &c.

 $\therefore \mathbf{\Psi} + \mathbf{\nabla} + \mathbf{\diamond} > \mathbf{I} + \mathbf{\nabla} + \mathbf{\diamond}.$ 

# Definition X

When three magnitudes are proportionals, the first is said to have to the third the duplicate ratio of that which it has to the second.

For example, if A, B, C, be continued proportionals, that is, A : B :: B : C, A is said to have to C the duplicate ratio of A : B;

or 
$$\frac{A}{C}$$
 = the square of  $\frac{A}{B}$ .

This will be more readily seen of the quantities  $ar^2$ , ar, a, for  $ar^2 : ar :: ar : a$ ;

and 
$$\frac{ar^2}{a} = r^2 =$$
 the square of  $\frac{ar^2}{ar} =$ ,  
or of *a*, *ar*, *ar*<sup>2</sup>;  
for  $\frac{a}{ar^2} = \frac{1}{r^2} =$  the square of  $\frac{a}{ar} = \frac{1}{r}$ .

# **Definition XI**

When four magnitudes are continual proportionals, the first is said to have to the fourth the triplicate ratio of that which is has to the second; and so on, quadruplicate, &c. increasing the denomination still by unity, in any number of proportionals.

For example, let A, B, C, D, be four continued proportionals, that is, A : B :: B : C :: C : D; A is said to have to D, the triplicate ratio of A to B;

or 
$$\frac{A}{D}$$
 = the cube of  $\frac{A}{B}$ .

220

This definition will be better understood, and applied to a great number of magnitudes than four that are continued proportionals, as follows :—

Let  $ar^3$ ,  $ar^2$ , ar, a, be four magnitudes in continued proportion, that is,  $ar^3 : ar^2 :: ar^2 : ar :: ar : a$ , then  $\frac{ar^3}{a} = r^3 =$  the cube of  $\frac{ar^3}{ar^2} = r$ .

Or, let  $ar^5$ ,  $ar^4$ ,  $ar^3$ ,  $ar^2$ , ar, a, be six magnitudes in proportion, that is

$$ar^{5} : ar^{4} :: ar^{4} : ar^{3} :: ar^{3} :$$

$$ar^{2} :: ar^{2} : ar :: ar : a,$$
then the ratio
$$\frac{ar^{5}}{a} = r^{5} = \text{ the fifth power of } \frac{ar^{5}}{ar^{4}} = r$$

Or, let a, ar,  $ar^2$ ,  $ar^3$ ,  $ar^4$ , be five magnitudes in continued proportion; then  $\frac{a}{ar^4} = \frac{1}{r^4} =$ the fourth power of  $\frac{a}{ar} = \frac{1}{r}$ .

# Definition A

To know a compound ratio :--

When there are any number of magnitudes of the same kind, the first is said to have to the last of them the ratio compounded of the ratio which the first has to the second, and of the ratio which the second has to the third, and of the ratio which the third has to the fourth; and so on, unto the last magnitude. For example, if A, B, C, D, be four mag-

nitudes of the same kind, the first A is said to have to the last D the ratio compounded of the ratio of A to B, and of the ratio of B to C, and of the ratio of C to D; or, the ratio of A to D is said to be compounded of the ratios of A to B, B to C, and C to D.

And if *A* has to *B* the same ratio which *E* has to *F*, and *B* to *C* the same ratio that *G* has to *H*, and *C* to *D* the same that *K* has to *L*; then by this definition, *A* is said to have to *D* the ratio compounded of ratios which are the same with the ratios of *E* to *F*, *G* to *H*, and *K* to *L*. And the same thing is to be saying, *A* has to *D* the ratio compounded of the ratios of *E* to *F*, *G* to *F*, *G* to *H*, and *K* to *L*.

In like manner, the same things being supposed; if M has to N the same ratio which A has to D, then for shortness sake, M is said to have to N the ratio compounded of the ratios E to F, G to H, and K to L.

This definition may be better understood from an arithmetical or algebraical illustration; for, in fact, a ratio compounded of several other ratios, is nothing more than a ratio which has for its antecedent the continued product of all antecedents of the ratios compounded, and for its consequent the continued product of all the consequents of the ratios compounded.

Thus, the ratio compounded of the ratios of

2:3,4:7,6:11,2:5,

is the ratio of  $2 \times 4 \times 6 \times 2$ :  $3 \times 7 \times 11 \times 5$ , or the ratio of 96 : 1155 or 32 : 285.

And of the magnitudes A, B, C, D, E, F, of the same kind, A : F is the ratio compounded of the ratios of

A: B, B: C, C: D, D: E, E: F;for  $A \times B \times C \times D \times E: B \times C \times D \times E \times F$ , or  $\frac{A \times B \times C \times D \times E}{B \times C \times D \times E \times F} = \frac{A}{F},$ or the ratio of A: F.

ATIOS which are compounded of the same ratios are same to one another.

Let A : B :: F : G, B : C :: G : H, C : D :: H : K, and D : E :: K : L,

Then the ratio which is compounded by the ratios of A : B, B : C, C : D, D : E, or the ratio of A : E, is the same as the ratio compounded of the ratios F : G, G : H, H : K, K : L, or the ratio of F : L.

For 
$$\frac{A}{B} = \frac{F}{G}$$
,  
 $\frac{B}{C} = \frac{G}{H}$ ,  
 $\frac{C}{D} = \frac{H}{K}$ ,  
and  $\frac{D}{E} = \frac{K}{L}$ ;  
 $\therefore \frac{A \times B \times C \times D}{B \times C \times D \times E} = \frac{F \times G \times H \times K}{G \times H \times K \times L}$ ,  
and  $\therefore \frac{A}{E} = \frac{F}{L}$ ,

or the ratio of A : E is the same as the ratio F : L.

The same may be demonstrated of any number of ratios so circumstanced.

Next, let A : B :: K : L, B : C :: H : K,

**A B C D E F G H K L** 

$$C: D :: G : H$$
,  
and  $D: E :: F : G$ ,

Then the ratio which is compounded of the ratios of A : B, B : C, C : D, D : E, or the ratio of A : E, is the same as the ratio compounded of the ratios of K : L, H : K, G : H, F : G, or the ratio of F : L

For 
$$\frac{A}{B} = \frac{K}{L}$$
,  
 $\frac{B}{C} = \frac{H}{K}$ ,  
 $\frac{C}{D} = \frac{G}{H}$ ,  
and  $\frac{D}{E} = \frac{F}{G}$ ;  
 $\therefore \frac{A \times B \times C \times D}{B \times C \times D \times E} = \frac{K \times H \times G \times F}{L \times K \times H \times G}$ ,  
and  $\therefore \frac{A}{E} = \frac{F}{L}$ ,

or the ratio of A : E is the same as the ratio F : L.

 $\therefore$  Ratios which are compounded, &c.

F several ratios be the same to several ratios, each to each, the ratio which is compounded of ratios which are the same to the first ratios,

each to each, shall be the same to the ratio compounded of ratios which are the same to the other ratios, each to each.

A B	C D E F G H	$P \ Q \ R \ S \ T$
a $b$	c $d$ $e$ $f$ $g$ $h$	V W X Y Z
If $A:B::a:b$	and $A:B::P:Q$	and $a:b::V:W$
C:D::c:d	C:D::Q:R	c:d::W:X
E:F::e:f	E:F::R:S	e:f:: X : Y
and $G: H :: g: h$	G:H::S:T	f:h::Y:Z
	then $P: T =$	V:Z.
	For $\frac{P}{Q} = \frac{A}{B} =$ $\frac{Q}{R} = \frac{C}{D} =$ $\frac{R}{S} = \frac{E}{F} =$ $\frac{S}{T} = \frac{G}{H} =$	$\frac{a}{b} = \frac{V}{W}$ $\frac{c}{d} = \frac{W}{X}$ $\frac{e}{f} = \frac{X}{Y}$ $\frac{g}{h} = \frac{Y}{Z}$
and $\cdot$	$\cdot \frac{P \times Q \times R \times S}{Q \times R \times S \times T} =$	$\frac{V \times W \times X \times Y}{W \times X \times Y \times Z},$
and $\therefore \frac{P}{T} = \frac{V}{Z}$ ,		
or $P: T = V: Z$ .		
$\therefore$ If several ratios, &c.		

F a ratio which is compounded of several ratios be the same to a ratio which is compounded of several other ratios; and if one of

227

the first ratios, or the ratio which is compounded of several of them, be the same to one of the last ratios, or to the ratio which is compounded of several of them; then the remaining ratio of the first, or, if there be more than one, the ratio compounded of the remaining ratios, shall be the same to the remaining ratios, shall be the same to the remaining ratio of the last, or, if there be more than one, to the ratio, compounded of these remaining ratios.

Let A : B, B : C, C : D, D : E, E : F, F : G,G : H, be the first ratios, and P : Q, Q : R, R : S,S : T, T : X, the other ratios; also, let A : H, which is compounded of the first ratios, be the same as the ratio of P : X, which is the ratio compounded of the other ratios; and, let the ratio A : E, which is compounded of the ratios of A : B, B : C, C : D,D : E, be the same as the ratio of P : R, which is compounded of the ratios P : R, which is

Then the ratio which is compounded of the remaining first ratios, that is, the ratio compounded of the ratios E : F, F : G, G : H, that is,the ratio E : H, shall be the same as the ratio R : X, which is compounded of the ratios R : S, S : T, T : X, the remaining ratios.

Because 
$$\frac{A \times B \times C \times D \times E \times F \times G}{B \times C \times D \times E \times F \times G \times H} = \frac{P \times Q \times R \times S \times T}{Q \times R \times S \times T \times X},$$

### A B C D E F G H P Q R S T X

or 
$$\frac{A \times B \times C \times D}{B \times C \times D \times E} \times \frac{E \times F \times G}{F \times G \times H} =$$
  
 $\frac{P \times Q}{Q \times R} \times \frac{R \times S \times T}{S \times T \times X},$   
and  $\frac{A \times B \times C \times D}{B \times C \times D \times E} = \frac{P \times Q}{Q \times R}$   
 $\therefore \frac{E \times F \times G}{F \times G \times H} = \frac{R \times S \times T}{S \times T \times X},$   
 $\therefore \frac{E}{H} = \frac{R}{X},$   
 $\therefore E : H = R : X.$ 

 $\therefore$  If a ratio which, &c.

F there be any number of ratios, and any number of other ratios, such that the ratio which is compounded of ratios, which are the same

to the first ratios, each to each, is the same to the ratio which is compounded of ratios, which are the same, each to each, to the last ratios—and if one of the first ratios, or the ratio which is compounded of ratios, which are the same to several of the first ratios, each to each, be the same to one of the last ratios, or to the ratio which is compounded of ratios, which are the same, each to each, to several of the last ratios—then the remaining ratio of the first; or, if there be more than one, the ratio which is compounded of ratios, which are the same, each to each, to the remaining ratios of the first, shall be the same to the remaining ratio of the last; or, if there be more than one, to the ratio which is compounded of ratios, which are the same, each to each, to these remaining ratios.

h  k  m  n  s	
A B, C D, E F, G H, K L, M N	a  b  c  d  e  f  g
OP, QR, ST, VW, XY	hklmnp
$a \ b \ k \ m \ e \ f \ g$	

Let A : B, C : D, E : F, G : H, K : L, M : N, be the first ratios, and O : P, Q : R, S : T, V : W, X : Y, the other ratios;

```
and let A : B = a : b,

C : D = b : c,

E : F = c : f,

G : H = d : e,

K : L = e : f,

M : N = f : g.
```

Then, by the definition of a compound ratio, the ratio of a : g is compounded of the ratios a : b, b : c, c : d, d : e, e : f, f : g, which are the same as the ratio of A : B, C : D, E : F, G : H, K : L, M : N, each to each.

Also, 
$$O : P = h : k$$
,  
 $Q : R = k : l$ ,  
 $S : T = l : m$ ,  
 $V : W = m : n$ ,  
 $X : Y = n : p$ ,

Then will the ratio of h : p be the ratio compounded of the ratios h : k, k : l, l : m, m : n, n : p, which are the same as the ratios of O : P, Q : R, S : T, V : W, X : Y, each to each.

 $\therefore$  by the hypothesis a : g = h : p.

Also, let the ratio which is compounded if the ratios of A : B, C : D, two of the first ratios (or the ratios of a : c for A : B = a : b, and C : D = b : c), be the same as the ratio of a : d, which is compounded of the ratios of a : b, b : c, c : d, which

are the same as the ratios of O: P, Q: R, S: T, three of the other ratios.

And let the ratios of h: s, which is compounded of the ratios h: k, k: m, m: n, n: s, which are the same as the remaining first ratios, namely, E: F, G: H, K: L, M: N; also, let the ratio of e: g, be that which is compounded of the ratios e: f, f: g, which are the same, each to each, to the remaining other ratios, namely V: W, X: Y. Then the ratios of h: s shall be the same as the ratio of e: g; or h: s = e: g.

For 
$$\frac{A \times C \times E \times G \times K \times M}{B \times D \times F \times H \times L \times N} = \frac{a \times b \times c \times d \times e \times f}{b \times c \times d \times e \times f \times g}$$

and  $\frac{O \times Q \times S \times V \times X}{P \times R \times T \times W \times Y} = \frac{h \times k \times l \times m \times n}{k \times l \times m \times n \times p}$ , by the composition of the ratios;

$$\therefore \frac{a \times b \times c \times d \times e \times f}{b \times c \times d \times e \times f \times g} = \frac{h \times k \times l \times m \times n}{k \times l \times m \times n \times p}$$
(hyp.),

or  $\frac{a \times b}{b \times c} \times \frac{c \times d \times e \times f}{d \times e \times f \times g} = \frac{h \times k \times l}{k \times l \times m} \times \frac{m \times n}{n \times p}$ ,

but  $\frac{a \times b}{b \times c} = \frac{A \times C}{B \times D} = \frac{O \times Q \times S}{P \times R \times T} =$  $\frac{a \times b \times c}{b \times c \times d} = \frac{h \times k \times l}{k \times l \times m};$  $\therefore \frac{c \times d \times e \times f}{d \times e \times f \times a} = \frac{m \times n}{n \times p}.$ 

And 
$$\frac{c \times d \times e \times f}{d \times e \times f \times g} = \frac{h \times k \times l \times m \times n \times n}{k \times l \times m \times n \times p}$$
 (hyp.),  
and  $\frac{m \times n}{n \times p} = \frac{e \times f}{f \times g}$  (hyp.),  
 $\therefore \frac{h \times k \times l \times m \times n}{k \times l \times m \times n \times p} = \frac{ef}{fg}$ ,  
 $\therefore \frac{h}{s} = \frac{e}{g}$ ,  
 $\therefore h : s = e : g$ .

 $\therefore$  If there be any number, &c.

# Book 6

# Definitions

1

Rectilinear figures are said to be similar, when they have their several angles equal, each to each, and the sides about the equal angles proportional.

### 2

Two sides of one figure are said to be reciprocally proportional to two sides of another figure when one of the sides of the first is to the second, as the remaining side of the second is to the remaining side of the first. 3

A straight line is said to be cut in extreme and mean ratio, when the whole is to the greater segment, as the greater segment is to the less.

#### 4

The altitude of any figure is the straight line drawn from its vertex perpendicular to its base, or the base produced.

RIANGLES and parallelograms having the same altitude are to one another as their bases.

Let the triangles and have a common vertex and their bases — and — in the same straight line.

Produce \_\_\_\_\_ both ways, take successively on \_\_\_\_\_ produced lines equal to it; and on \_\_\_\_\_ produced lines successively equal to it; and draw lines from the common vertex to their extremities.

The triangles thus formed are all equal to one another, since their bases are equal. (pr. 1.38)

.. *I* and its base are respectively equimul-

tiples of and the base ——.

In like manner **L** and its base are respec-

tively equimultiples of and the base ——.

 $\therefore$  if *m* or 6 times >, = or < n or 5 times then *m* or 6 times  $\longrightarrow$  >, = or < n or 5 times , *m* and *n* stand for every multiple taken as in the fifth definition of the Fifth Book. Although we have only shown that this property exists when m equal 6, and n equal 5, yet it is evident that the property holds good for every multiple value that may be given to m, and to n.

Parallelograms having the same altitude are the doubles of the triangles, on their bases, and are proportional to them (Part I), and hence their doubles, the parallelograms, are as their bases. (pr. 5.15)

Q. E. D.

F a straight line — be drawn parallel to any side … of a triangle, it shall cut the other sides, or those sides produced, into pro-

portional segments

And if any straight line ——— divide the sides of a triangle, or those sides produced, into proportional segments, it is parallel to the remaining side ……….

Q. E. D.

a triangle, divides the opposite side into segments ( \_\_\_\_\_, .......) proportional to the conterminous sides ( \_\_\_\_\_, \_\_\_\_). And if a straight line ( \_\_\_\_\_) drawn from any angle of a triangle divide the opposite side ( \_\_\_\_\_\_) into segments ( \_\_\_\_\_, .....) proportional to the conterminous sides ( \_\_\_\_\_, \_\_\_\_), it bisects the angle.

RIGHT line ( — ) bisecting the angle of

N equiangular triangles (  $\bigwedge$  and  $\bigwedge$  ) the sides about the equal angles are proportional, and the sides which are opposite to the equal angles are homologous.

Let the equiangular triangles be so placed that two sides ——, …… opposite to equal angles  $\bigtriangleup$  and  $\bigtriangleup$  may be conterminous, and in the same straight line; and that the triangles lying at the same side of that straight line; and that the triangles lying at the same side of that straight line, may have the equal angles not conterminous, i. e.  $\checkmark$  opposite to  $\checkmark$ , and  $\land$  to  $\land$ .

and therefore, ex æquali,

therefore the sides about the equal angles are proportional, and those which are opposite to the equal angles are homologous.

Q. E. D.

) they are equiangular, and the equal angles are subtended by the homologous sides.

From the extremities of -, draw and -, making  $\checkmark = \land, \checkmark = \land$  (pr. 1.23); and consequently  $\checkmark = \checkmark$  (pr. 1.32), and since the triangles are equiangular,  $: \cdots : : - : - (pr. 6.4);$ but  $\cdots : : - : - (pr. 6.4);$ but  $\cdots : : - : - : - (pr. 6.4);$ but  $\cdots : : - : - : - (pr. 5.9).$ In like manner it may be shown that

Therefore, the two triangles having a common base ——, and their sides equal, have also equal angles opposite to equal sides, i. e.

▲ = ▼ and △ = ▼ (pr. 1.8).
but ▼ = ▲ (const.) and ∴ ▲ = ▲; for the same reason △ = ▲, and consequently ▲ = ▲ (pr. 1.32); and therefore the triangles are equiangular, and it is evident that the homologous sides subtended by the equal angles.

F two triangles (  $\bigwedge$  and  $\bigwedge$  ) have one angle (  $\bigwedge$  ) of the one, equal to one angle (  $\bigwedge$  ) of the other, and the sides about the

243

equal angles proportional, the triangles shall be equiangular, and have those angles equal which the homologous sides subtend.

From the extremities of \_\_\_\_\_, one of the sides of  $(\Delta)$ , about  $(\wedge)$ , draw — and …, making 💙 = 🤺 and  $\nabla = d$ then  $\nabla = 4$  (pr. 1.32), and two triangles being equiangular, .. ..... : —— : —— (pr. 5.11), and consequently  $\cdots = - (pr. 5.9);$ in every respect (pr. 1.4). but  $\checkmark$  =  $\checkmark$  (const.), and  $\therefore \bigwedge = \bigwedge;$ and since also  $\bigwedge = \bigwedge$  ,  $\triangle = \triangle$  (pr. 1.32); and  $\therefore$  and  $\bigtriangleup$  are equiangular, with their equal angles opposite to homologous sides.

Q. E. D.

:: ••••••• ; ••••••), and each of the remaining angles (  $\checkmark$  and  $\checkmark$ ) either less or not less than a right angle, the triangles are equiangular, and those angles are equal about which the sides are proportional.

First let it be assumed that the angles A and  $\bigtriangleup$  are each less than a right angle: then if it be supposed that  $\checkmark$  and  $\checkmark$  contained by the proportional sides are not equal, let  $\checkmark$  be greater, and make  $\checkmark = \checkmark$ .

Because  $\checkmark = \checkmark$  (hyp.) and  $\checkmark = \checkmark$  (const.)  $\therefore = \Delta$  (pr. 1.32);

therefore less than a right angle, which is absurd.  $\therefore$   $\checkmark$  and  $\checkmark$  are not unequal;

:. they are equal, and since  $\checkmark = \checkmark$  (hyp.) :.  $\checkmark = \checkmark$  (pr. 1.32), and therefore the triangles are equiangular.

But if  $\triangleleft$  and  $\bigtriangleup$  be assumed to be each not less than a right angle, it may be proved as before, that the triangles are equiangular, and have the sides about equal angles proportional. (pr. 6.4).

Q. E. D.

N a right angled tiangle ( ), if a perpendicular ( ) be drawn from the right angle to the opposite side, the triangles

( \_\_\_\_\_, ) on each side of it are similar to the whole triangle and to each other.

From either extremity of the given line draw making any angle with ; and produce ; line contains as often as contains the required part.

Draw \_\_\_\_\_, and draw \_\_\_\_\_ || \_\_\_\_\_.

— is the required part of ——….

For since .... || \_\_\_\_\_ (pr. 6.2), and by composition (pr. 5.18);

but — as often as contains — as often as \_\_\_\_\_ contains the required part (const.);

 $\therefore$  — is the required part.

Q. E. D.

o divide a given straight line ( )
 similarly to a given divided line ( ).

From either extremity of the given line draw making any angle;

take ....., .... and .... equal to \_\_\_, \_\_\_ and \_\_\_ respectively (pr. 1.2);

draw ——, and draw …… and —  $\parallel$  to it.

Since  $\{ \underbrace{ \dots \dots } \}$  are  $\parallel$ ,  $- : - : \cdots : \cdots : (pr. 6.2),$ or - : - : - : - : (const.),and  $- : - : \cdots : \cdots : (pr. 6.2),$  $- : - : \cdots : \cdots : (const.),$ 

Q. E. D.

o find a third proportional to two given straight lines ( and ).

0 find a fourth proportional to three given lines  $\left\{ \begin{array}{c} \\ \\ \\ \\ \end{array} \right\}$ .

$$: - - - : - - (pr. 6.2);$$
  
but  $\{ - - - - : - - (pr. 5.7).$   
 $\therefore - - - : - - (pr. 5.7).$   
Q. E. D.

0 find a mean proportional between two 

Draw any straight line \_\_\_\_\_, make  $---- = \cdots$  and  $---- = \cdots$ ; bisect \_\_\_\_\_; and from the point of bisection as a centre, and half line as a radius, describe a semicircle draw —  $\perp$  —: - is the mean proportional required. Draw — and ……. Since  $\checkmark$  is a right angle (pr. 3.31), and <u>is  $\perp$  from it upon the opposite side</u>,  $\therefore$  — is a mean proportional between — and — (pr. 6.8), and .. between ..... and ..... (const.).

Q. E. D.

And parallelograms which have one angle in each equal, and the sides about the reciprocally proportional, are equal.

Let \_\_\_\_\_ and \_\_\_\_; and \_\_\_\_ and \_\_\_\_, be so placed that \_\_\_\_\_ and \_\_\_\_ may be continued right lines. It is evident that they may assume this position. (pr. 1.13, pr. 1.14, pr. 1.15)

(•

QUAL triangles, which have one angle in each equal (= ), have the sides about equal angles reciprocally proportional

And two triangles which have an angle of the one equal to an angle of the other, and the sides about the equal angles reciprocally proportional, are equal.

- : —— :: —— : —— )

I. Let the triangles be so placed that the equal angles and may be vertically opposite, that is to say, so that and may be in the same straight line. Whence also and must be in the same straight line (pr. 1.14).

tremes, is equal to the rectangle ( $----\times$ ) contained by the means

And if the rectangle contained by the extremes be equal to the rectangle contained by the means, the four straight lines are proportional.

that is, the rectangle contained be the extremes, equal to the rectangle contained be the means.

F three striaght lines be proportional ( \_\_\_\_\_\_ : \_\_\_\_\_\_ : \_\_\_\_\_) the rectangle under the extremes is equal to the square of

## the mean.

And if the rectangle under the extremes be equal to the square of the mean, the three straight lines are proportional.

therefore, if the three straight lines are proportional, the rectangle contained be the extremes is equal to the square of the mean.

It is evident from the construction and (pr. 1.32) that the figures are equiangular; and since the

In like manner it may be shown that the remaining sides of the two figures are proportional.

∴ by (pr. 6.1)
is similar to and similarly situated; and on the given line —.

IMILAR triangles ( A and A) are to one another in the duplicate ratio of their ho-mologous sides.

IMILAR polygons may be divided into the same number of similar triangles, each similar pair of which are proportional to the polygons; and the polygons are to each other in the duplicate

ratio of their homologous sides.

Draw — and … and and ....., resolving the polygons into triangles. Then because the polygons are similar  $\mathbf{A} = \mathbf{A}$ , and \_\_\_\_\_ : •••••• :: -\_\_\_\_ : ••••••  $\therefore$  and are similar, and  $\checkmark$  =  $\checkmark$  (pr. 6.6); but  $\mathbf{a} = \mathbf{b}$  because they are angles

of similar polygons; therefore the remainders  $\triangleright$  and  $\triangleright$  are equal; on account if the similar triangles, on account of the similar polygons, ex æquali (pr. 5.22), and as these proportional sides contain equal angles, the triangles

and / are similar (pr. 6.6).

and **v** are similar.

In like manner it may be shown that the

triangles

and as one of the antecedents is to one of the consequents, so is the sum of all the antecedents to the sum of all the consequents; that is to say, the similar triangles have to one another the same ratio as the polygons (pr. 5.12).

Q. E. D.

ECTILINEAR figures ( \_\_\_\_\_ and \_\_\_\_) which are similar to the same figure ( \_\_\_\_) are similar also to each other.

Since and are similar, they are equiangular, and have the sides about the equal angles proportional (def. 6.1); and since figures and are also similar, they are equiangular, and have the sides about the equal angles proportional; therefore and are also equiangular, and have the sides about the equal angles proportional (pr. 5.11), and therefore similar.

ures similarly described on them are also proportional.

And if four similar rectilinear figures, similarly described on four straight lines, be proportional, the straight lines are also proportional.

QUIANGULAR parallelograms ( and ) are to one another in a ratio com-

pounded of the ratios of their sides.

Let two of the sides <u>and</u> about the equal angles be placed so that they may form on straight line.

and the remaining opposite

📥 and 📥 are similar (pr. 6.4), - : ----- :: ------ : ------:

.. **—** 

angles proportional, and are therefore similar.

In the same manner it can be demonstrated that

the parallelograms and  $\square$  are similar. Since, therefore, each of the parallelograms

> 🗾 and 🗾 is similar to 🛛 they are similar to each other.

0 describe a rectilinear figure, which shall be similar to a given rectilinear figure (

),

and equal to another ( 🥌 ).

and then \_\_\_\_\_ and ..... will lie in the same straight line (pr. 1.29, pr. 1.14).

Between <u>and</u> and <u>find a</u> mean proportional <u>(pr. 6.13)</u>,

and upon —— describe 🦾 , similar

to \_\_\_\_\_, and similarly situated.

F similar and similarly posited parallelo-) have a comgrams ( ] mon angle, they are about the same diagonal. For, if possible, let \_\_\_\_\_ be the diagonal of and draw \_\_\_\_\_ || \_\_\_\_ (pr. 1.31). are about the Since same diagonal \_\_\_\_\_, and have common, they are similar (pr. 6.24); but — : — … … (hyp.), ·· --- : --- : ---- : -----, and  $\therefore$  — = — (pr. 5.9), which is absurd.  $\therefore$  is not the diagonal of  $\mathbf{A}$ in the same manner it can be demonstrated that no other line is except ——. Q. E. D.

F all the rectangles contained by the segments of a given straight line, the greatest is the square which is described on half the line.

For it has been demonstrated already (pr. 2.5), that the square of half the line is equal to the rectangle contained by any unequal segments together with the square of the part intermediate between the middle point and the point of unequal section. The square described on half the line exceeds therefore the rectangle contained by any unequal segments of the line.

## 272 BOOK 6 PROP. XXVIII. PROB.

0 divide a given straight line (·······) so that the rectangle contained by its segments may be equal to a given area, not exceeding the square of half the line.

Let the given area be =  $\dots^2$ . Bisect  $\cdots$ , or make  $\cdots$  =  $\cdots$ ; and if  $2 = 2^{2}$ , problem is solved. But if  $2 \neq 2^2$ , then must  $\cdots \rightarrow \cdots$  (hyp.). Draw —  $\perp$  ···· = ····; with **—** as radius describe a circle cutting the given line; draw ——. Then  $\cdots \times - - - 2 = - - 2^2$ (pr. 2.5) = - 2. But  $-2^2 = -2^2 + -2^2$  (pr. 1.47);  $\therefore \cdots \times - - - + - 2 = - 2 + - 2.$ from both take  $-^2$ , and  $\cdots \times - - 2$ . But — = ····· (const.), and : is so divided that  $\cdots \times - - 2$ .

o produce a given straight line (------), so that the rectangle contained by the segments between the extremities of the given line and the point to which it is produced, may be equal

to a given area, i. e. equal to the square on ——.

treme and mean ratio.

0 cut a given straight line (------) in ex-

Q. E. D.

F any similar rectilinear figures be similarly described on the sides of a right angled tri-

angle ( \_\_\_\_\_\_ ), the figure described on the side ( \_\_\_\_\_\_ ) subtending the right angle is equal to the sum of the figures on the other sides.

## 🔔 and 🔼 ), have F two triangles ( two sides proportional ( \_\_\_\_\_ : \_\_\_\_ :: : .....), and be so placed at an angle that the homologous sides are parallel, the remaining sides ( and .....) form one right line. Since \_\_\_\_\_ || ......, A = (pr. 1.29);and also since \_\_\_\_\_ || ......, 🤻 = 🔺 (pr. 1.29); $\therefore \land = \land$ ; and since the triangles are equiangular (pr. 6.6); $\therefore \land = \Delta;$ but $= \mathbf{\overline{y}};$ $\therefore \triangle + \checkmark + \triangle = \triangle + \triangle + \triangle = \frown$ (pr. 1.32),

276

and  $\therefore$  and  $\cdots$  lie in the same straight line (pr. 1.14).

BOOK 6 PROP. XXXII. THEOR.

N equal circles ( , ), angles, whether at the centre or circumference, are in the same ratio to one another as the arcs

on which they stand ( < : < : - : - : - : ); so also are sectors.

Take in the circumference of ( any number of arcs -, -, &c. each = -, and also in the circumference of ( take any number of arcs -, -, &c. each = -, draw the radii to the extremities of the equal arcs.

The since the arcs -, -, -, &c. are all equal, the angles  $\checkmark$ ,  $\checkmark$ ,  $\checkmark$ , &c. are also equal (pr. 3.27);  $\therefore$   $\checkmark$  is the same multiple of  $\checkmark$  which are  $\frown$  is of -; and in the same manner  $\checkmark$  is the same multiple of  $\checkmark$ , which the arc  $\checkmark$  is of arc -.

Then it is evident (pr. 3.27), if  $\checkmark$  (or if *m* times  $\checkmark$ )  $>,=,<\checkmark$  (or *n* times  $\checkmark$ ) then  $\checkmark$  (or *m* times  $\checkmark$ )  $>,=,<\checkmark$  (or *n* times  $\frown$ )  $>,=,<\checkmark$  (or *n* times  $\frown$ );  $\therefore \checkmark : \checkmark : \checkmark : \frown : \frown \cdots$  (def. 5.5), or the angles at the centre are as the arcs on which they

stand; but the angles at the circumference being halves of the angles at the centre (pr. 3.20) are in the same ratio (pr. 5.15), and therefore are as the arcs on which they stand.

It is evident, that sectors in equal circles, and on equal arcs are equal (pr. 1.4, 3.24, 3.27, and def. 3.9). Hence, if the sectors be substituted for the angles in the above demonstration, the second part of the proportion will be established, that is, in equal circles the sectors have the same ratio to one another as the arcs on which they stand.

Q. E. D.

F an angle of a triangle be bisected by a straight line, which likewise cuts the base; the rectangle contained by the sides of the trian-

gle is equal to the rectangle contained by the segments of the base, together with the square of the straight line which bisects the angle.

F from any angle of a triangle a straight line be drawn perpendicular to the base; the rectangle contained by the sides of the triangle is

equal to the rectangle contained by the perpendicular and the diameter of the circle described about the triangle.

Q. E. D.

HE rectangle contained by the diagonals of a quadrilateral figure inscribed in a circle, is equal to both the rectangles contained by its

opposite sides.
